Why ecologists love camera traps

*1400 pubs as of 2017

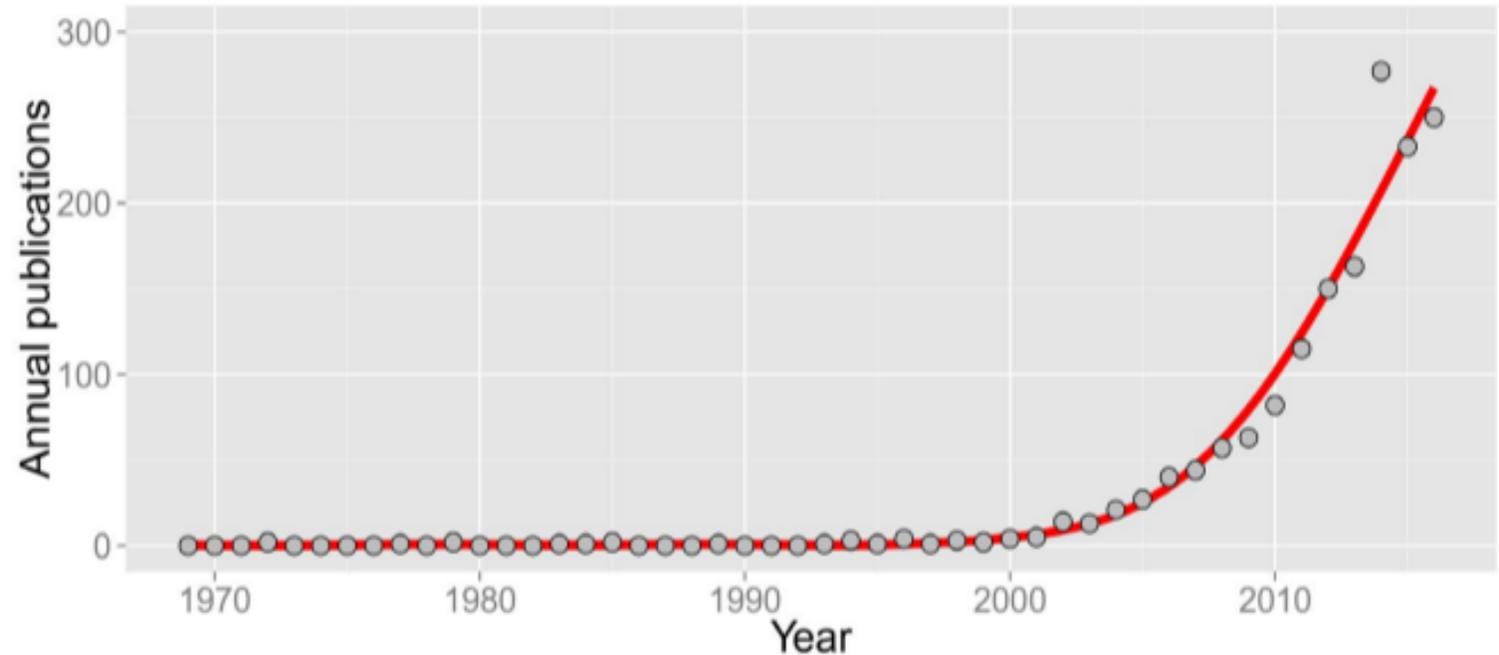

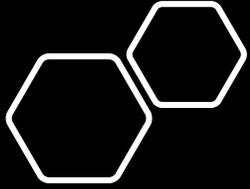

Figure 2-1. Annual number of articles listed in the Web of Science mentioning camera traps (or various other synonyms, such as automatic camera, game camera, or remote camera) between 1969 (the first year of reliable records) and 2016. For the period before 2000, a total of just 25 articles were listed, which is fewer than the annual number of publications from 2005 onwards. The figure for 2016 was extrapolated based on the results up to June of that year.

Wearn and Glover-Kapfer 2017. Camera-trapping guide for conservation: a guide to best-practices

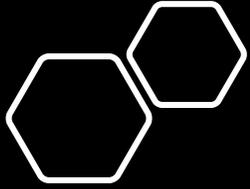

Why ecologists love camera traps

Logistical benefits

- Non-invasive
- Passive monitoring
- Long sample period
 - Detect hyper-rare events
- Readily available & inexpensive
- Easy setup/deploy
- Verifiable data & permanence
- Highly repeatable methodology

Why ecologists love camera traps

Research applications for camera traps

- Occupancy (habitat use and distribution)
- Abundance (relative & capture-recapture)
- Behavior (undisturbed)
- Community dynamics (e.g., cooccurrence)
- Biodiversity inventory (esp. rare species)
- And more!

So what's the catch!?

- Cost/benefit of cam traps
 - Large upfront \$\$
- Poor performance in extreme environments
- Limited species detection
 - Large, warm-blooded, active and terrestrial animals
- Fraction of area surveyed per camera
- False positives

Caused 33,000+ false positives!!

The camera trap dilemma

Benefit: easy to deploy cameras and collect a lot of data

Problem: storage, organization, data extraction

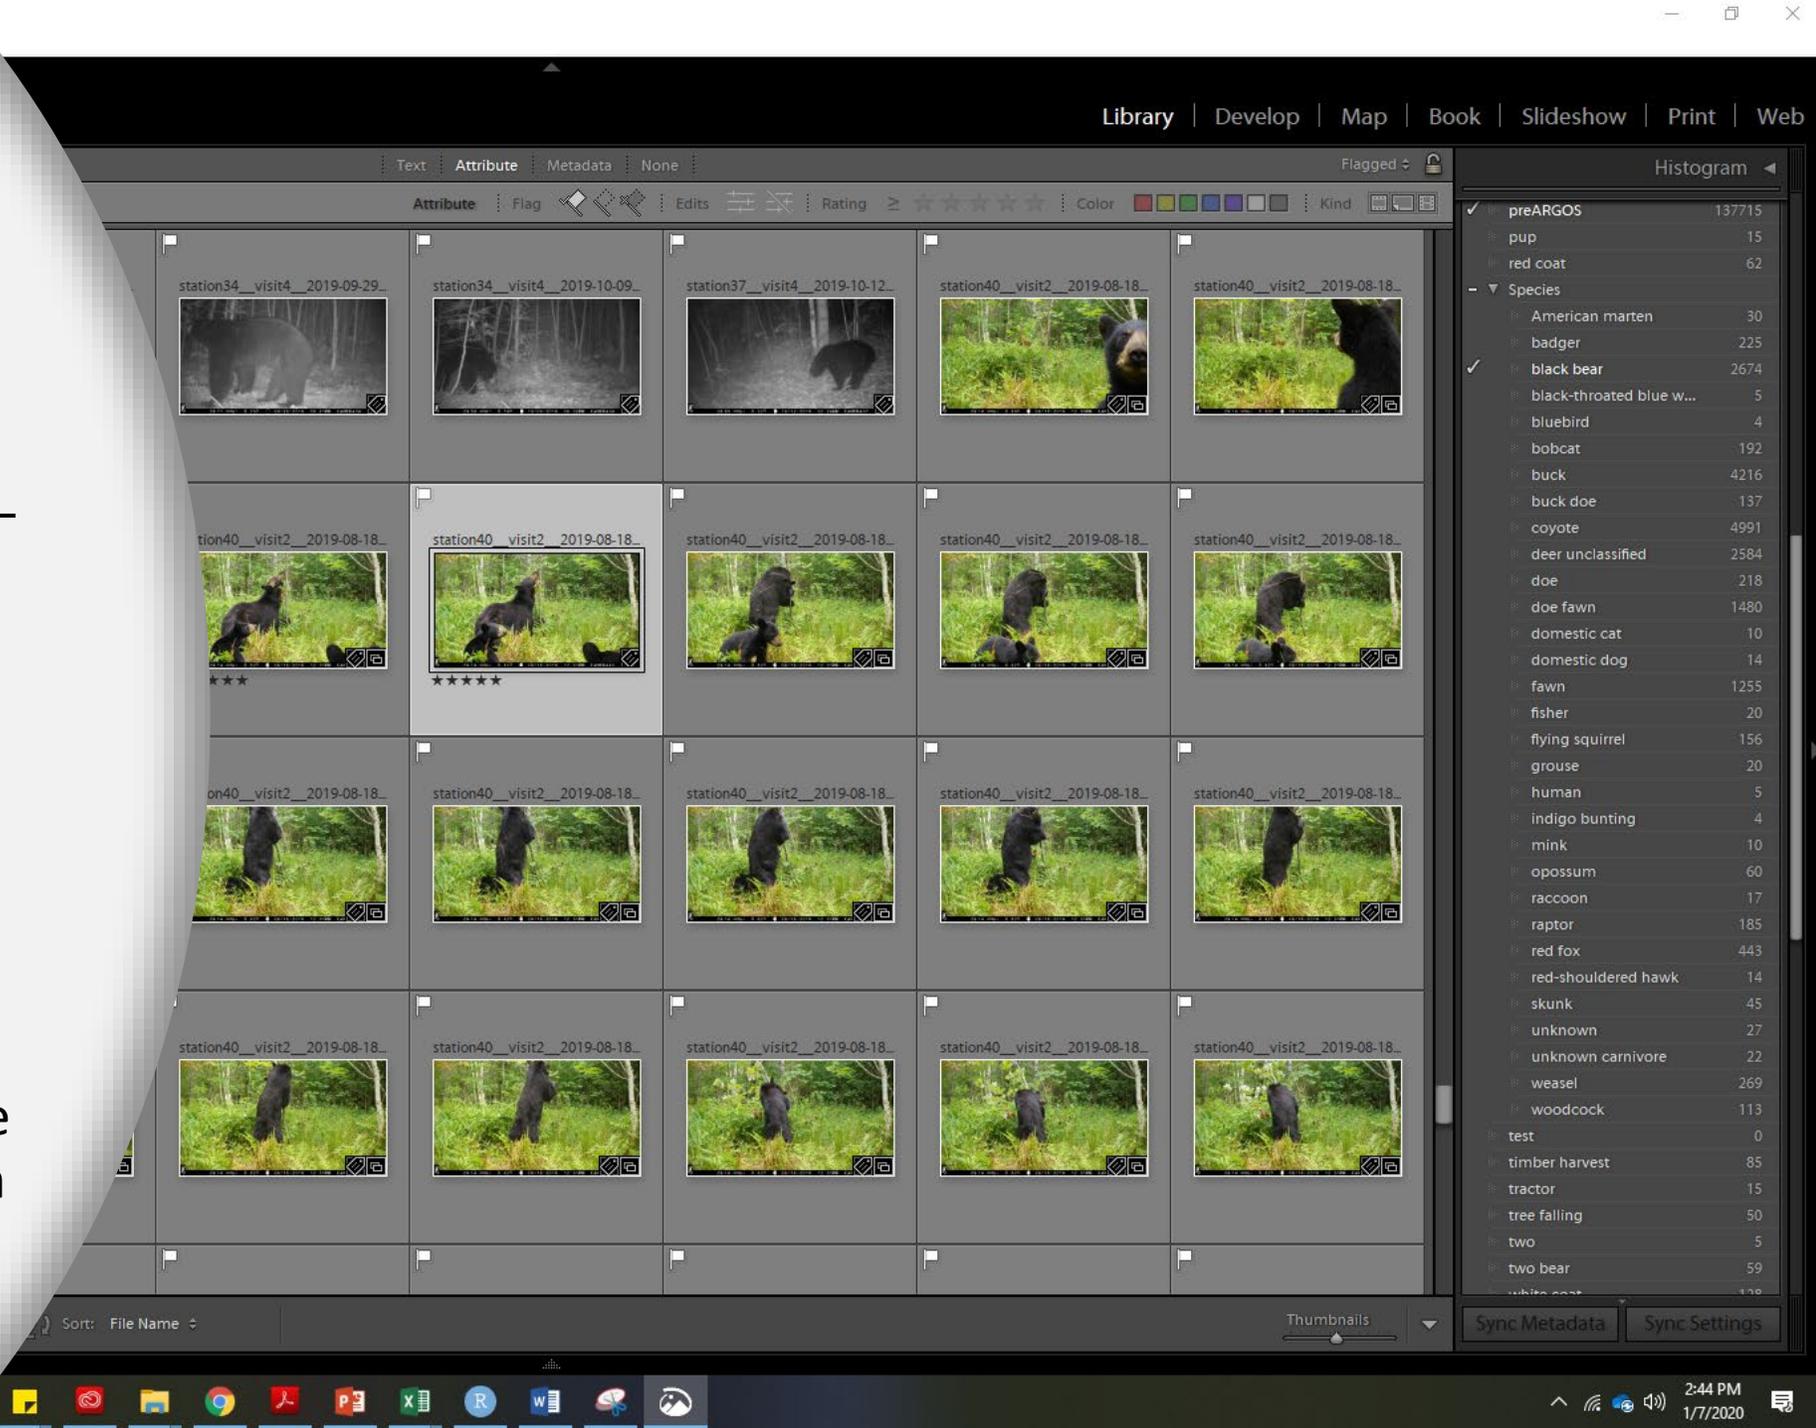

So. Many.
Photos.

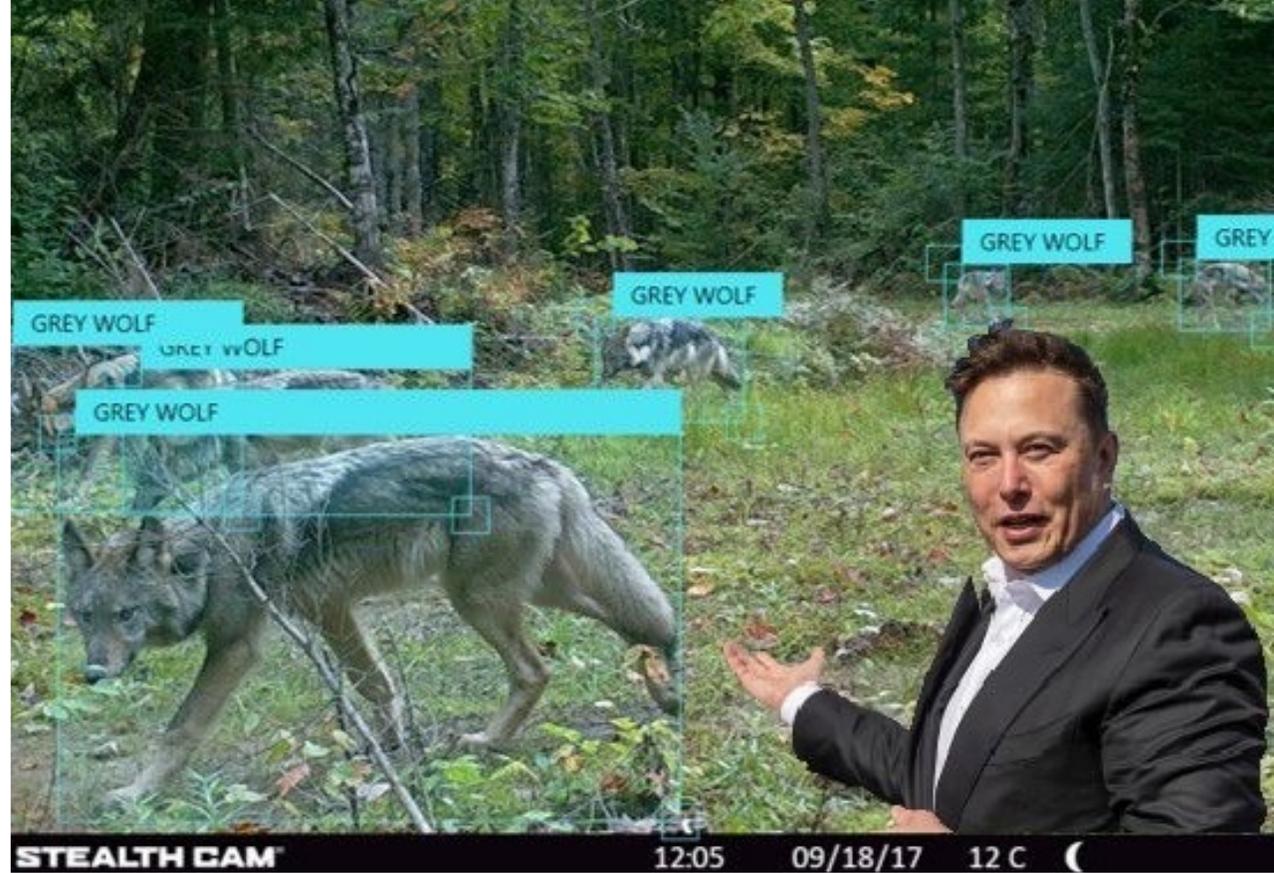

The camera trap dilemma

Time investment

- Manual annotation time
 - 600 – 3,000 photos/hour
 - ~166 – 833 hours of annotating 500,000 photos
- Identification fatigue and misclassification

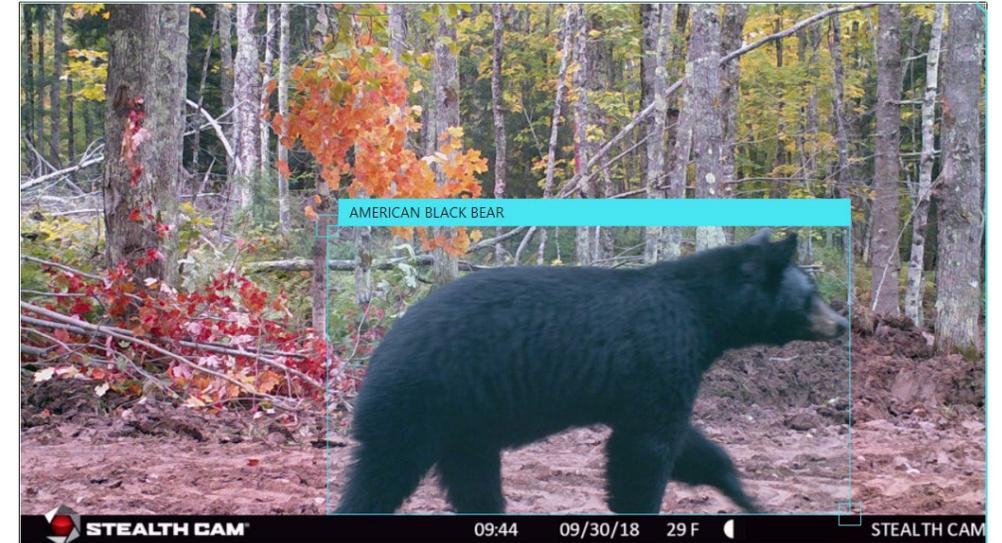

Big data solutions: Artificial Intelligence

Can we transfer this tech to camera trap data?

Interdisciplinary and Collaborative Approach

- Work directly with partners with expertise in machine learning
- Collaborative approach

18 SEP 2017

12:05:08 (7/9)

Tips

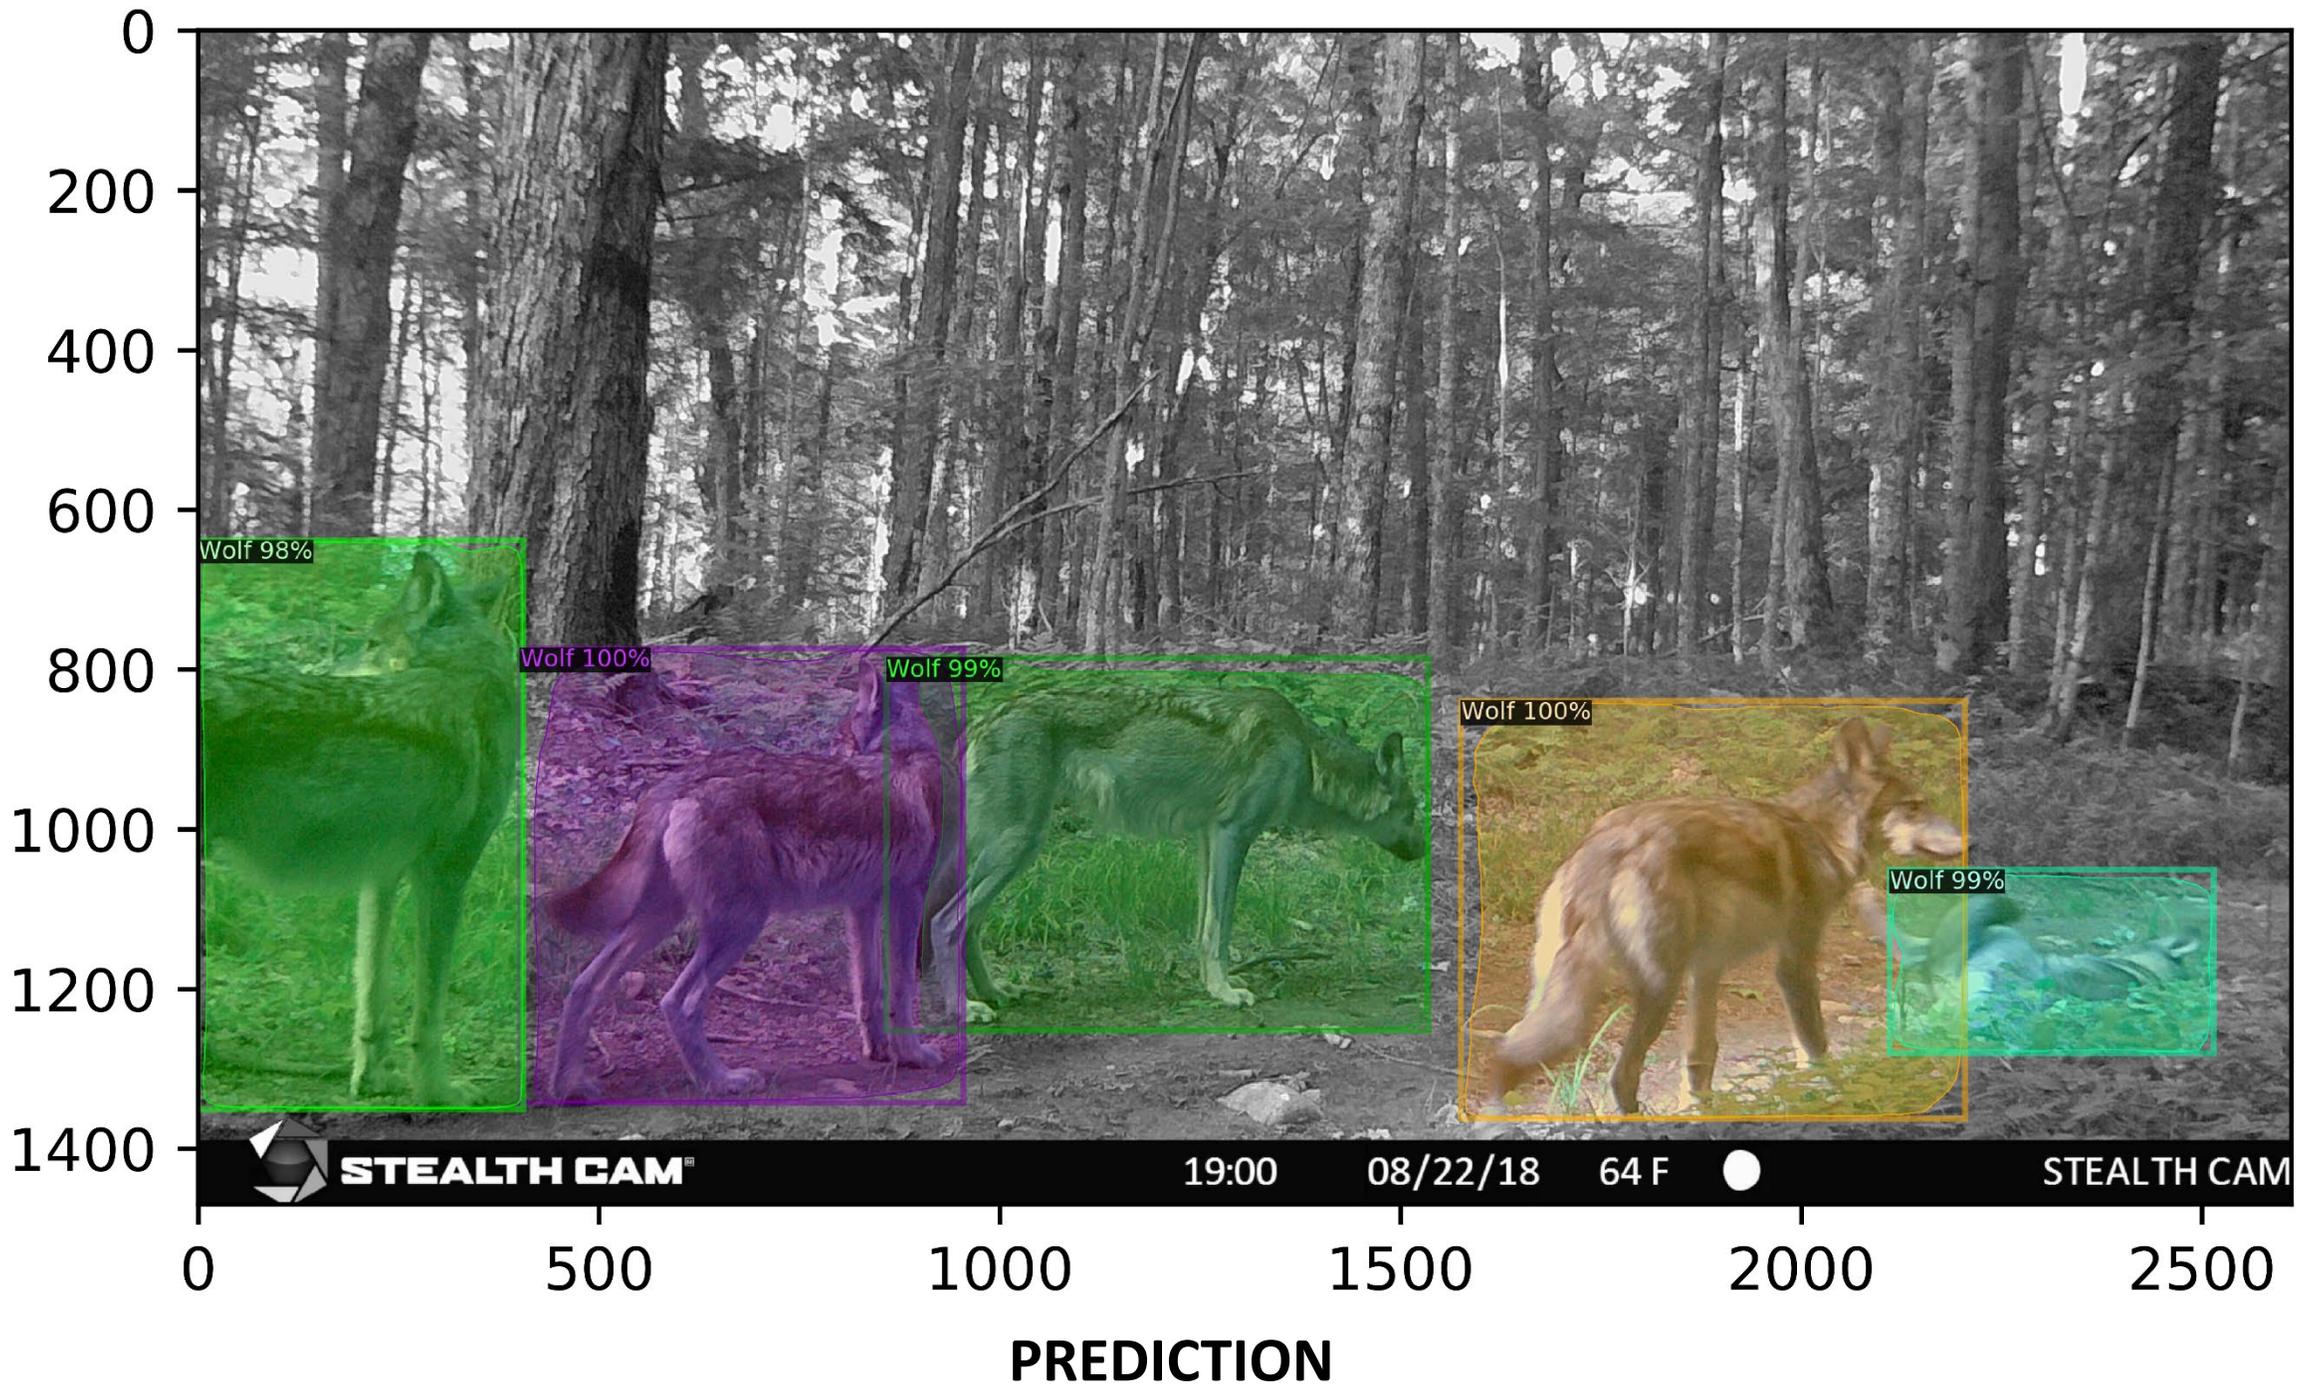

Use the arrow keys (←→) to switch between images in the current burst. Use **shift** + (←→) to navigate between camera bursts. Use the up arrow ↑ to return to the burst list.

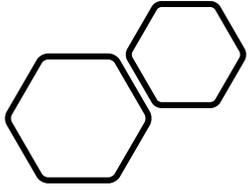

To label image content, first select a target above and then drag on the image to label image content. To delete a label, click on the label to select it, and then press **delete**.

To change a label's target species, select the label and then select a new target above.

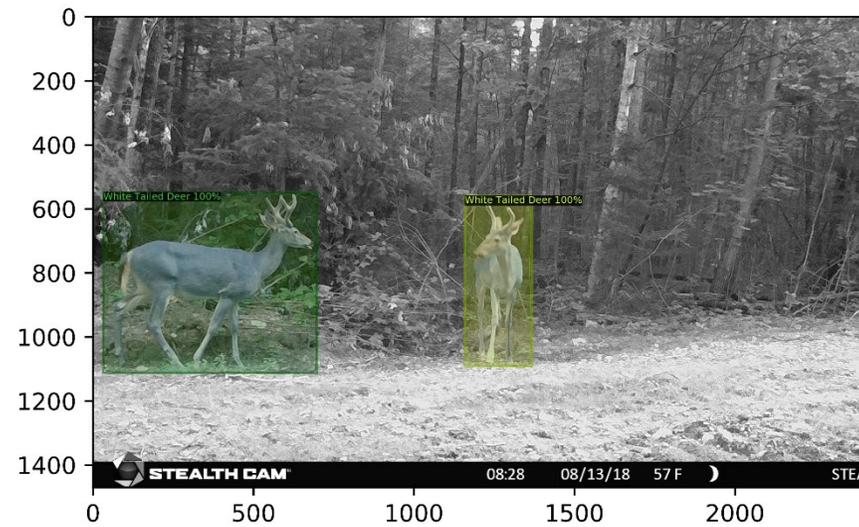

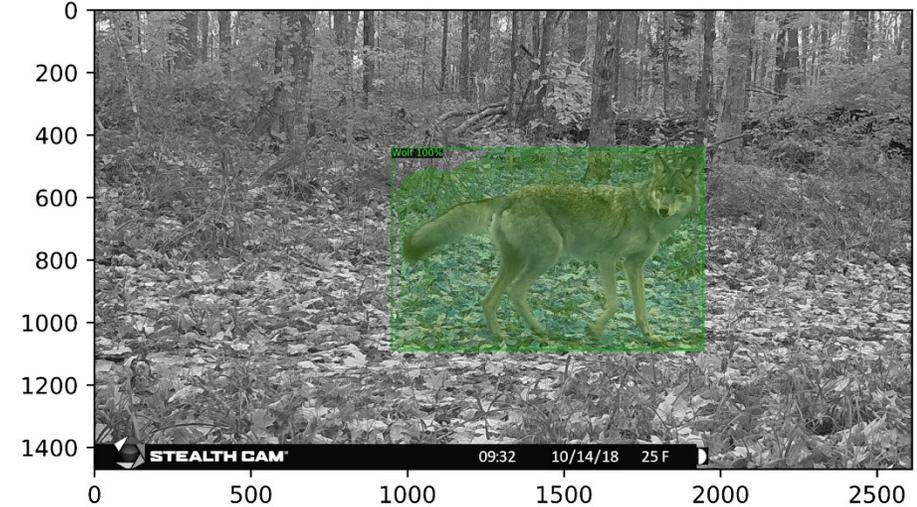

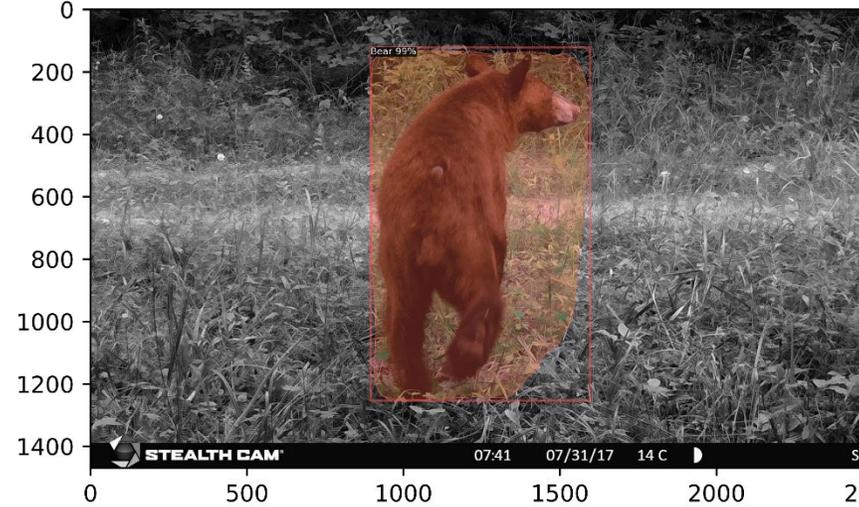

ANNOTATION

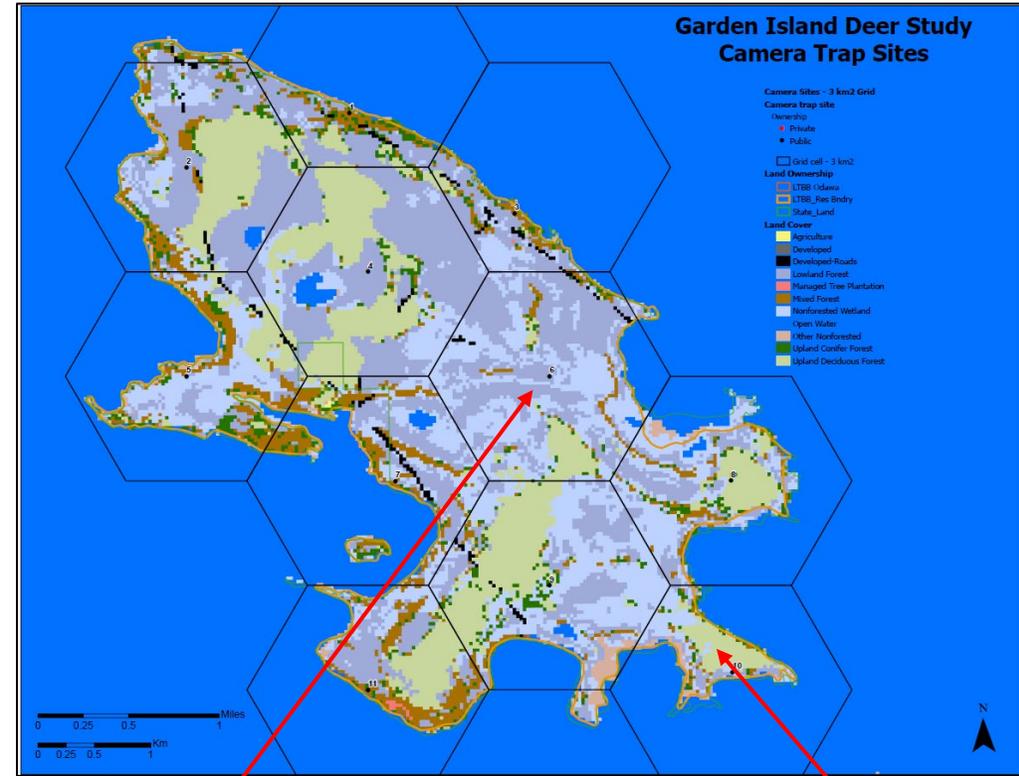

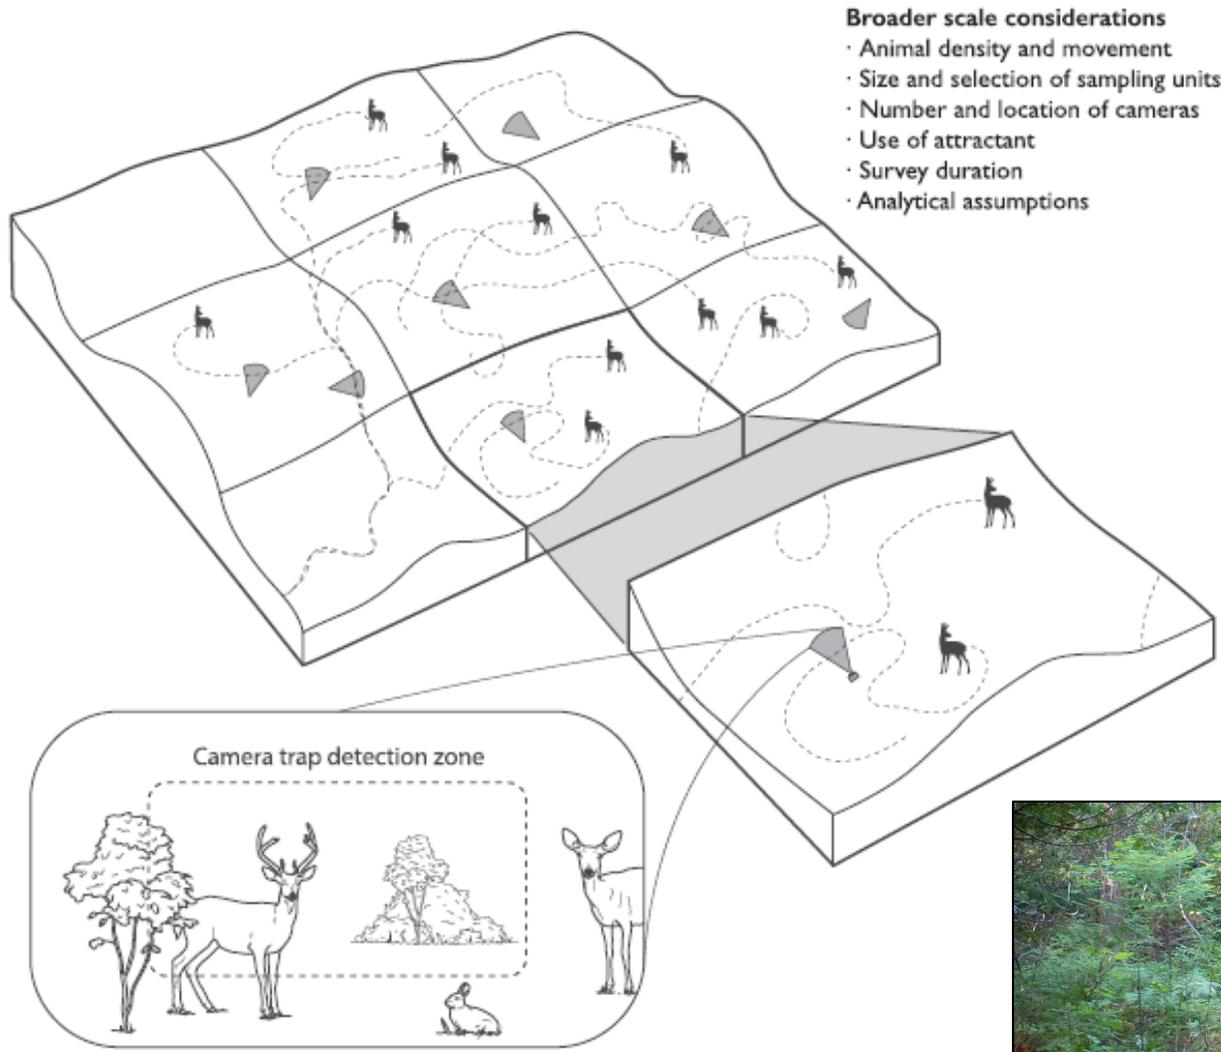

Continuing/Future Developments

- Continue growing the number of species models can identify
- Age/sex specific models (buck, doe, fawn)
- Behavioral trait models (vigilance, head up/down)

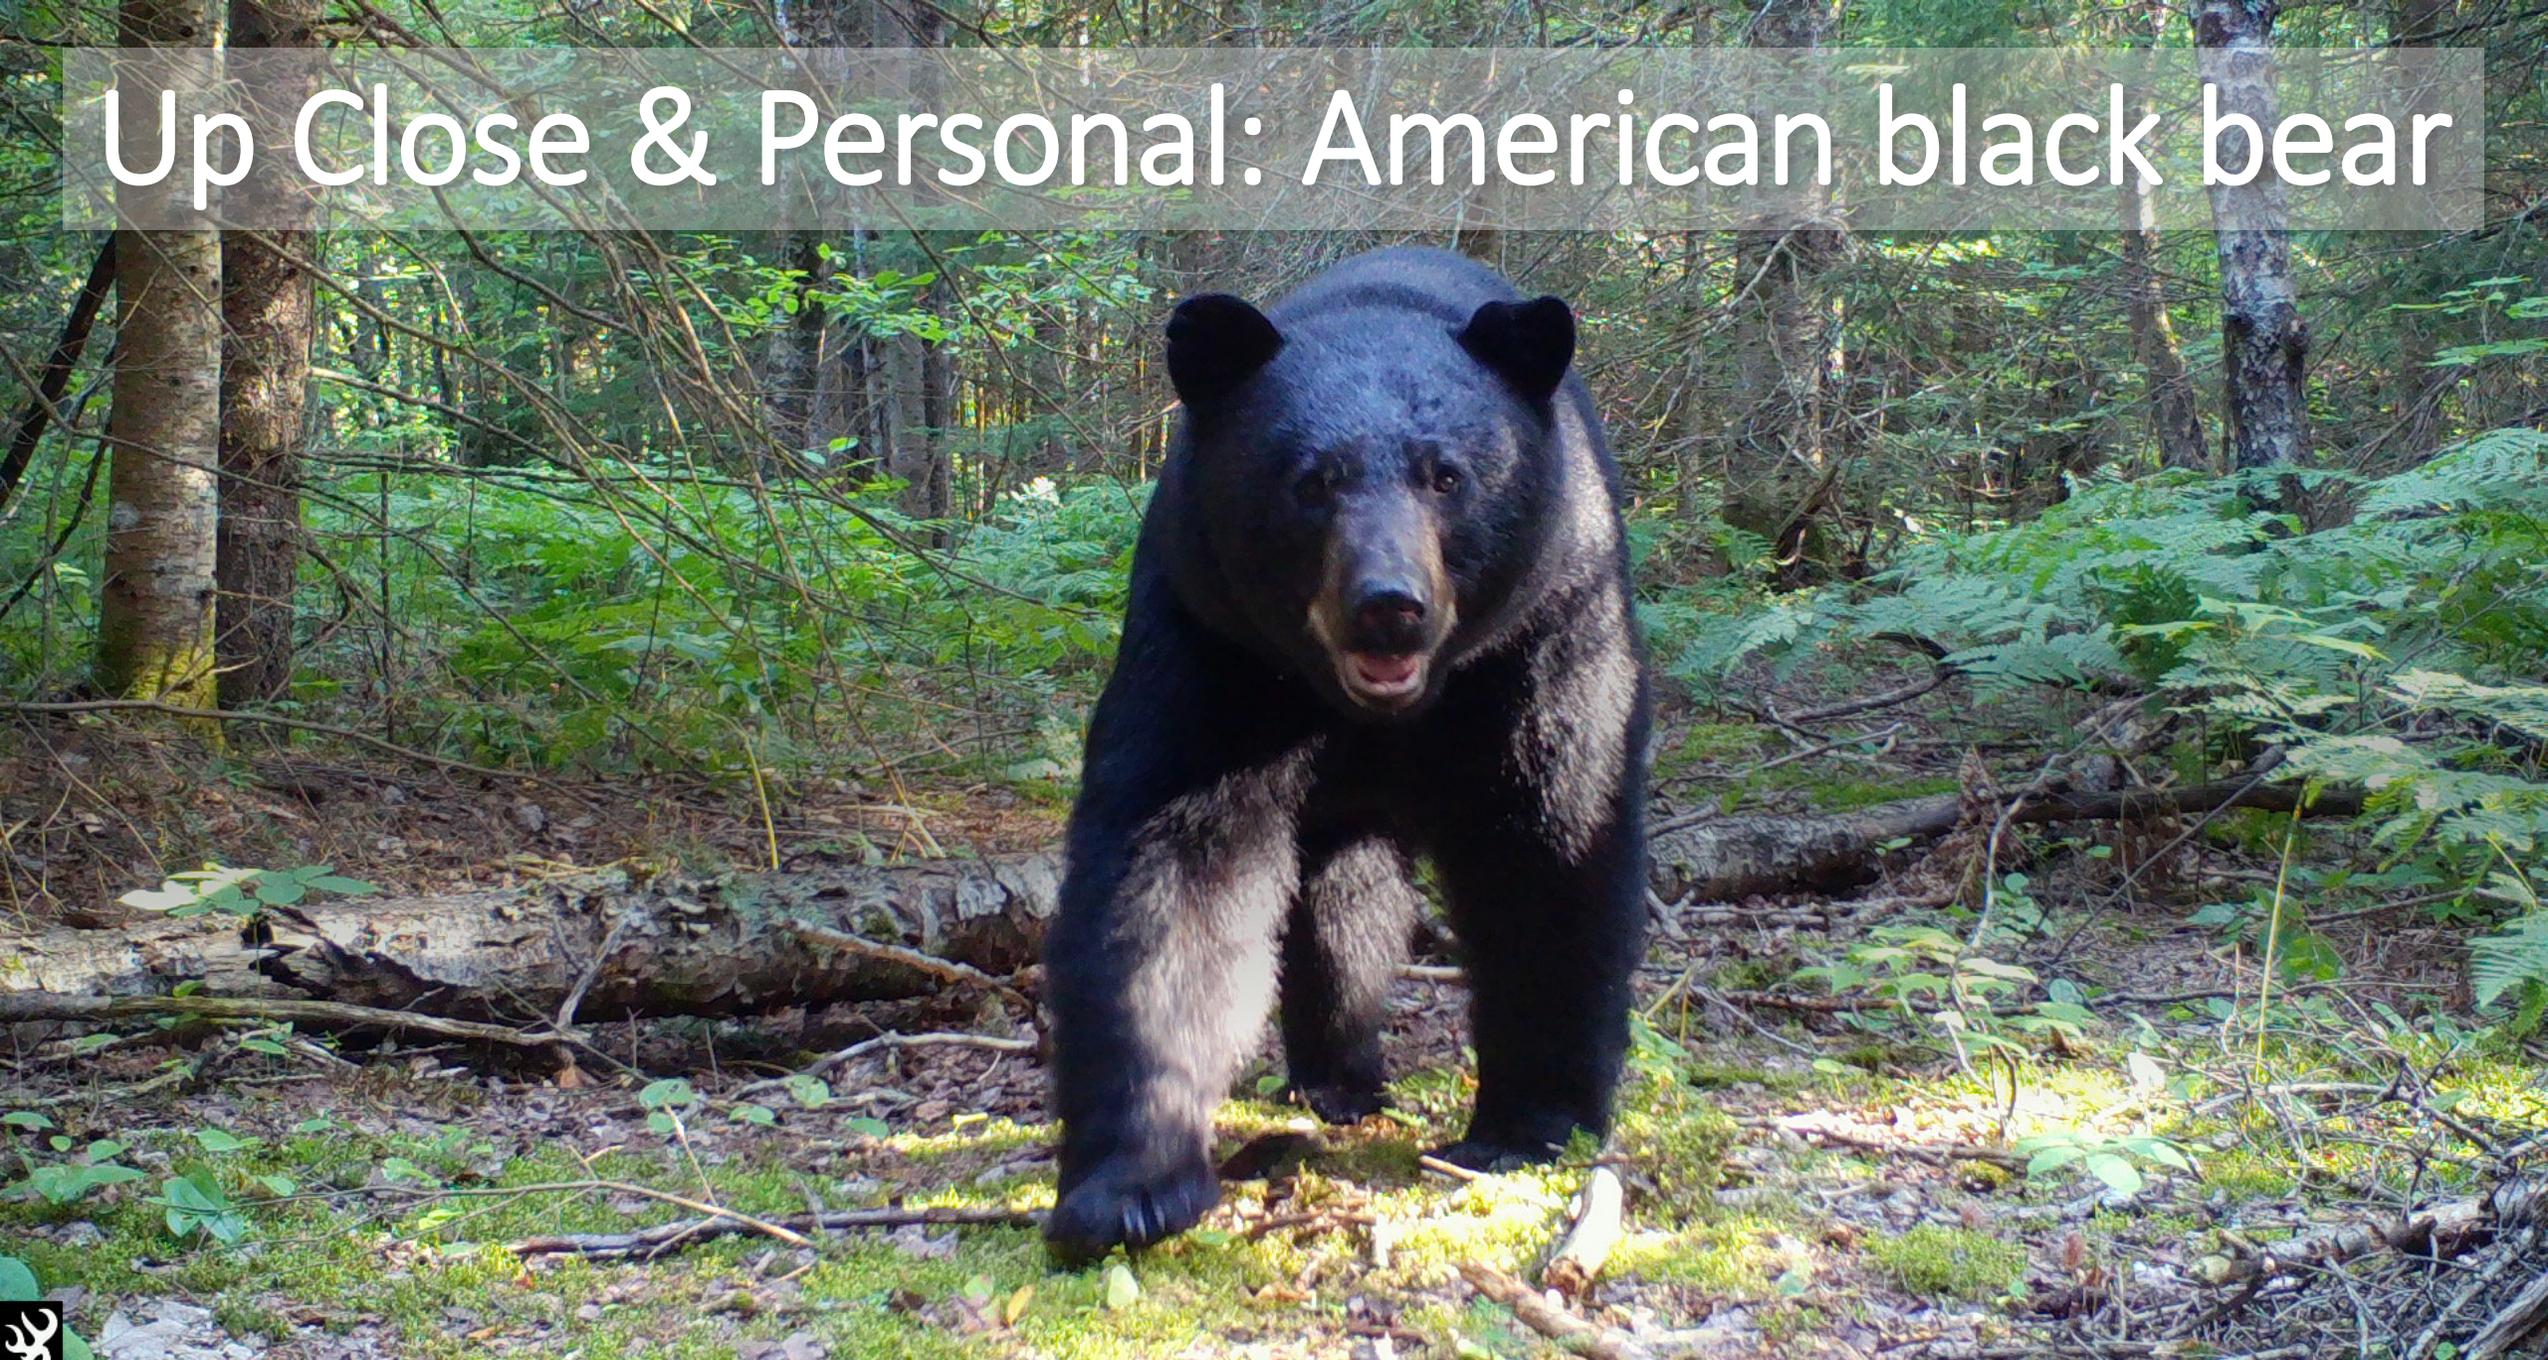

Designing a camera trap study for populations

American marten ecology & status

- Inhabit mix of mature hardwoods and conifers.
- Importance of large coarse woody debris and complex vertical/horizontal structure (hunting, denning)

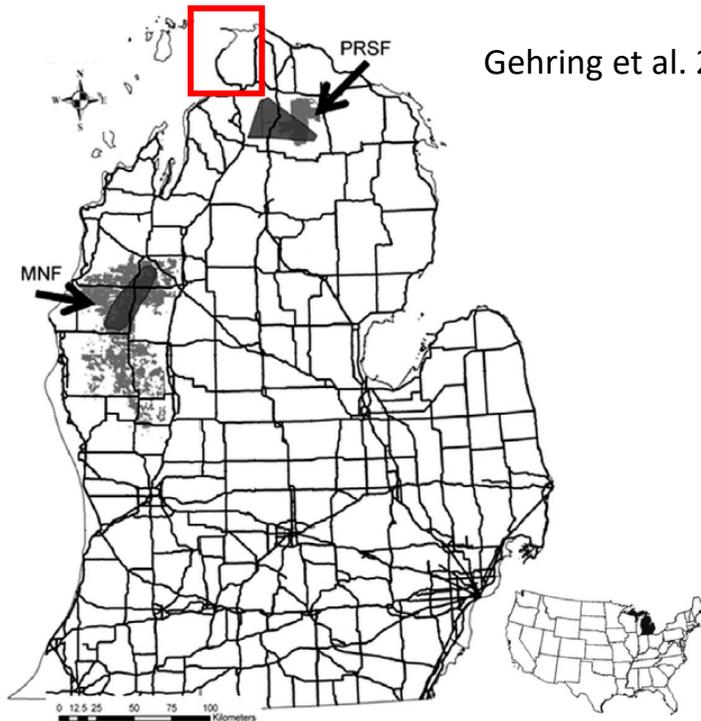

American marten ecology & status

240

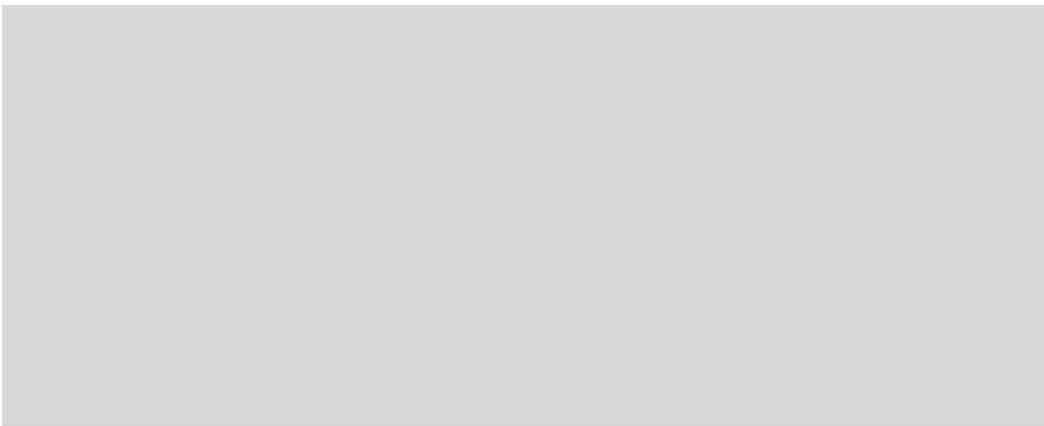

THE AMERICAN MIDLAND NATURALIST

182(2)

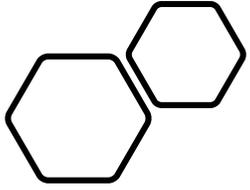

Gehring et al. 2019

- Extirpated in NLP by 1911
- Reintroduced 1985-86, small and isolated populations.
- Managed as furbearer, but harvest only in UP.

Long-tailed weasel

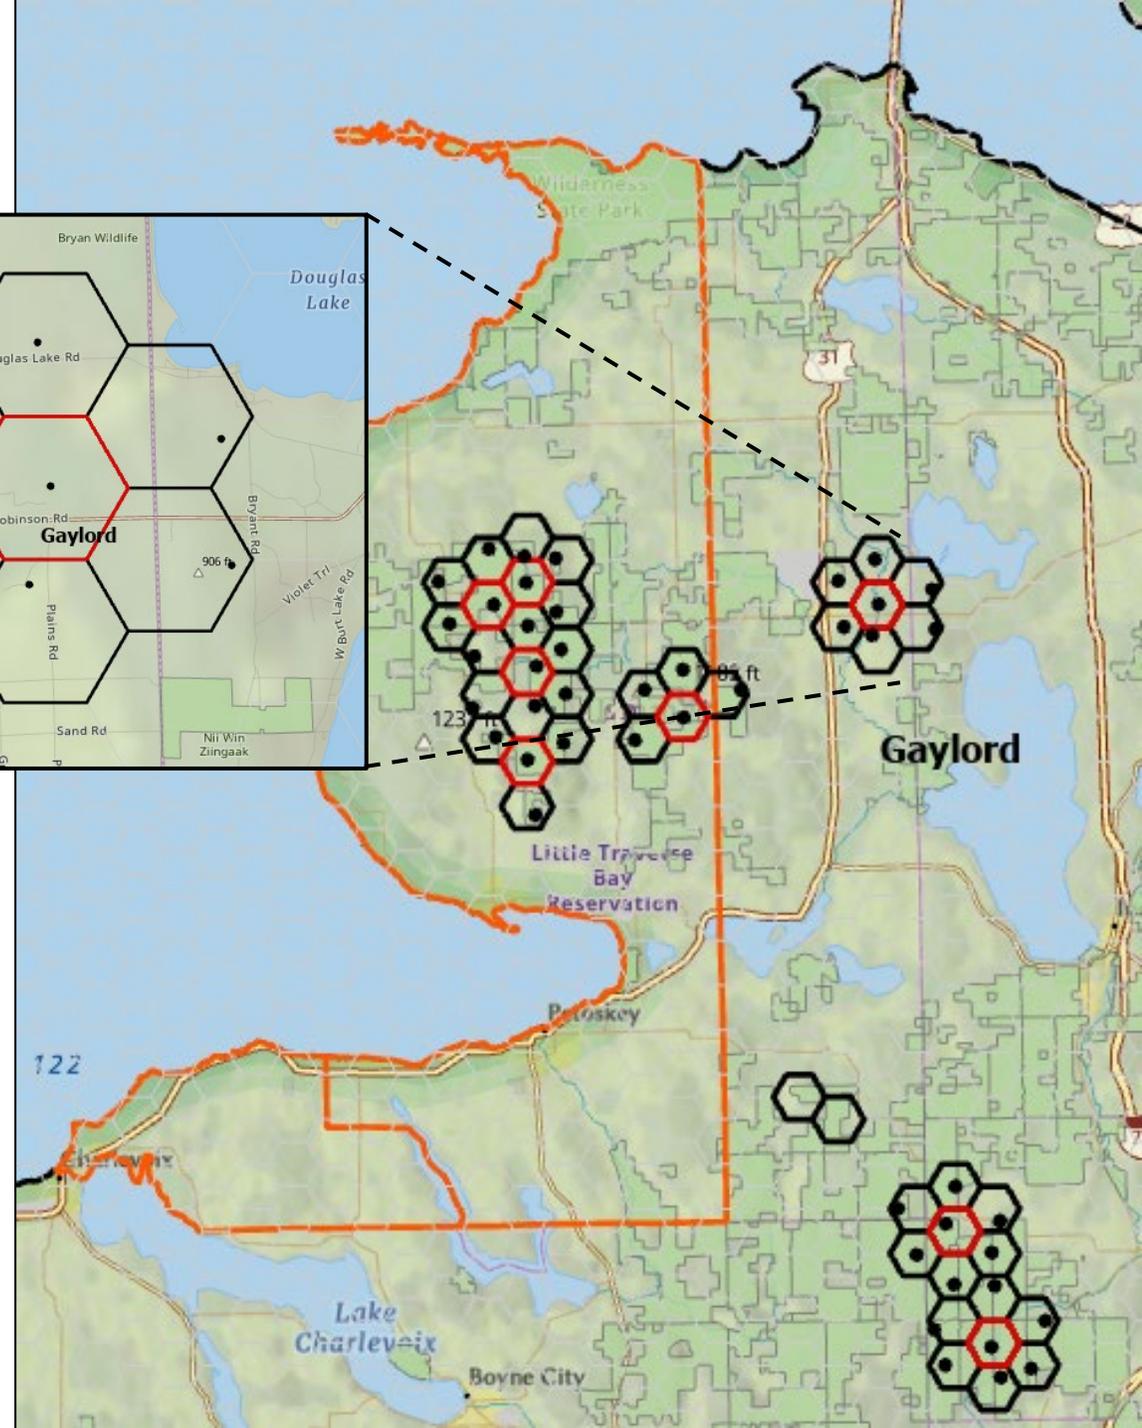

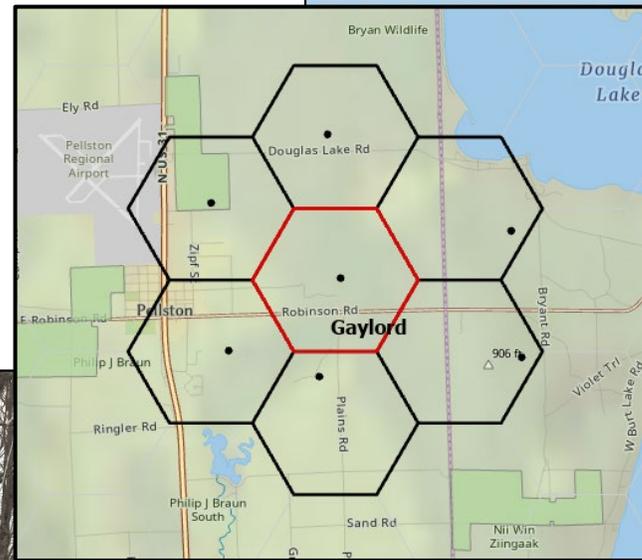

Fisher ecology & status

- Extirpated in NLP by early 1900s, little evidence of population in NLP.
- Managed as furbearer, but harvest only in UP.
- Inhabit mix of mature hardwoods and conifers, and lowland conifer.
- Importance of large coarse woody debris and complex vertical/horizontal structure (hunting, denning)

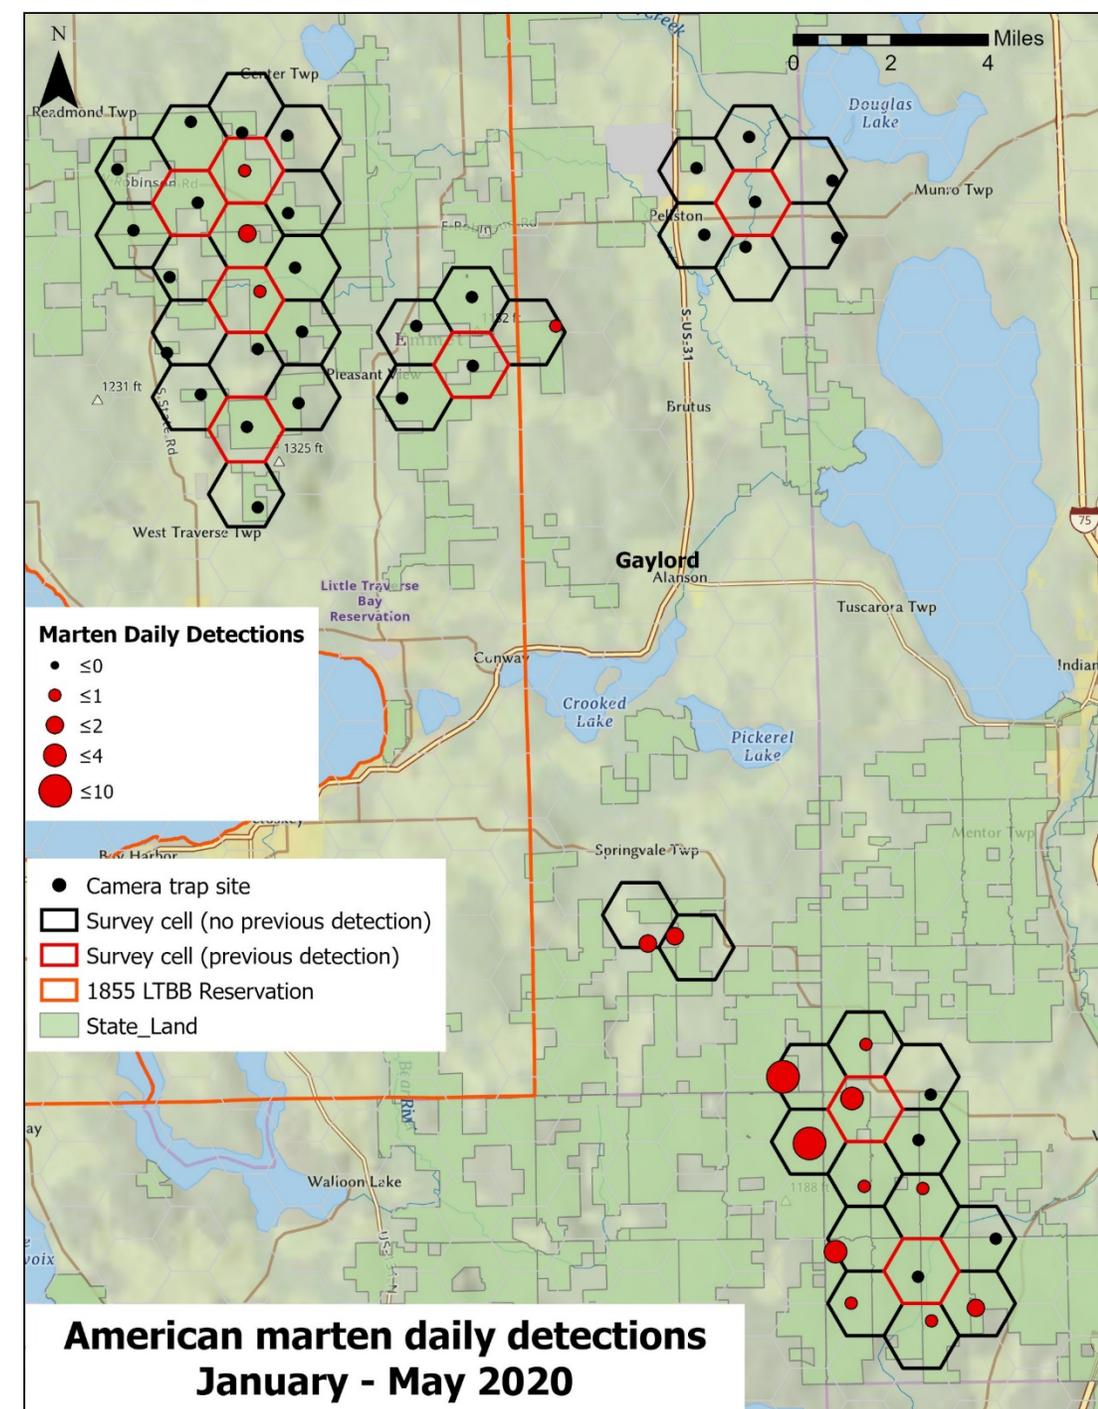

Study Design & Methods

Preliminary Results

- 16 camera sites detected marten
 - 42 total unique detection events
- 0 fisher detected

Management Implications

Anishinaabek history on the Beaver Islands

Coming home -- to Garden Island: Mose Anthony, Amos Anthony, John Anthony, Thomas Anthony, Jacob Anthony, two unknown women, and Agatha Cornstalk ("Agutum")

The Elders Speak

*Reflections on
Native American
Culture and Life*

*by
George A. Anthony*

- Amikwa (Beaver) tribal group were original inhabitants .
- Deteriorating relationships with Mormons in mid-1800s pushed Native American population to Garden and High Island.
- Forced back to Beaver Island and mainland in the 1930's and 1940's.
- Garden and High Islands included within the 1855 Little Traverse Bay Bands Of Odawa Indians Reservation.

Anishinaabek clan system

Clan System Chart BLM 8.2

Beaver Island Archipelago

- ~ 18 miles from mainland.
- Beaver Island is 56 mi² (145 km²)
 - 13 mi long, ~5 mi wide
 - ~600 residents
- Garden Island is 7 mi² (18 km²)
 - ~4.5 mi long, ~2 mi wide

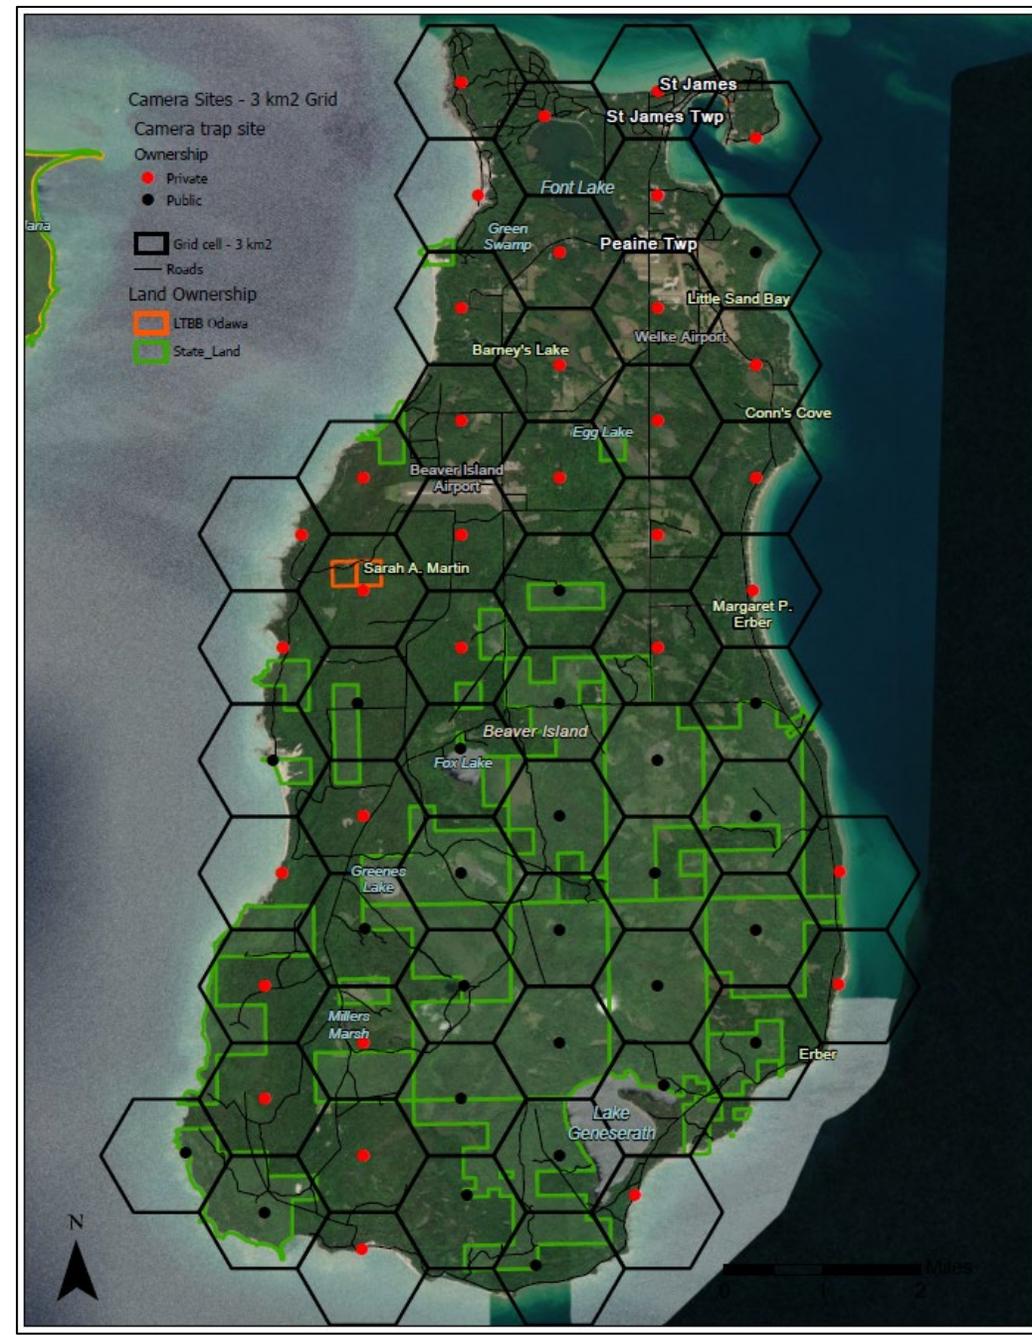

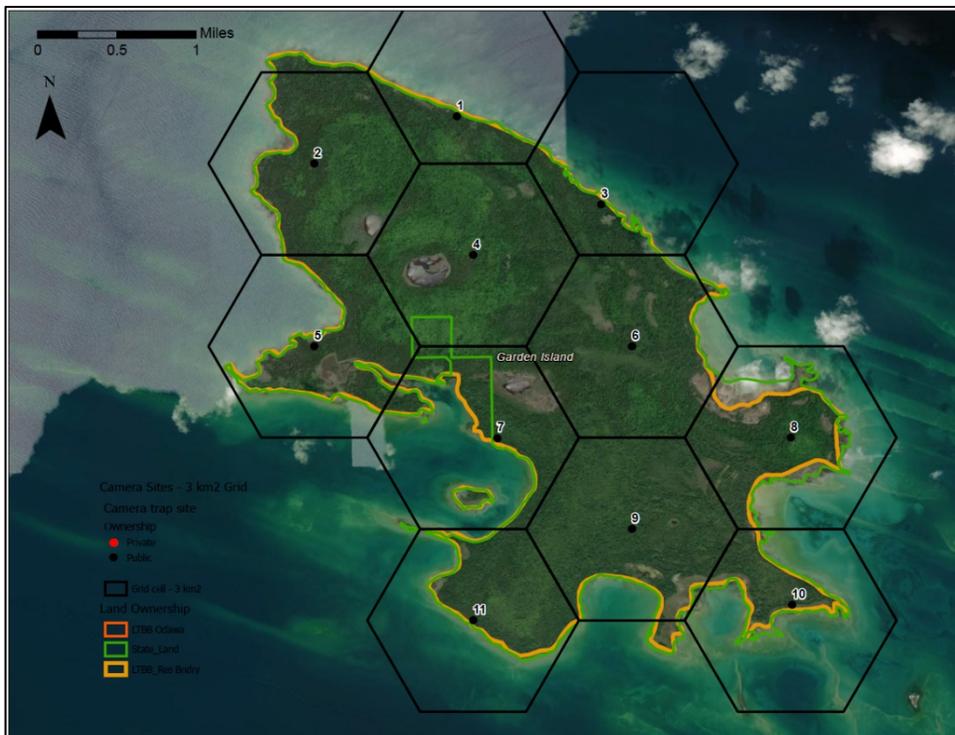

Deer ecology & history on Beaver Island

- Deer not endemic to Beaver Island
 - Introduced 3 bucks and 10 does in 1927.
- 1958 survey estimated ~27 deer per square mile.
- Occur throughout BI, but seasonal N-S migration to winter deer yards.
- Coyote only natural predator

Study Design & Methods

Estimating White-tailed Deer Density from Camera Trap Images

This application allows users to estimate white-tailed deer abundance and density using daily presence/absence data from remote camera sites independent camera sites (i.e., at least 1.6 km apart for white-tailed deer). Occupancy and abundance estimates are calculated using model 'occu', 'occuRN', 'pcount').
