Introduction

One hundred fifty (150) lines from 12 separate market classes were tested across six locations (Table 1) in 2021. In each table documenting the results, you will find such agronomic information as flowering date, plant maturity, height, and disease tolerance. Flowering and plant maturity are rated visually in days after planting (DAP) across all locations. Lodging is evaluated on a scale of 1 to 5, with a 1 indicating that the entry was completely erect in the field at harvest and a 5 indicating that the entry was flat on the ground with stems and pods touching the soils' surface. White mold infection was recorded in Huron County by calculating the percent of infection on each replication (number infected/total stand)*100). In 2021, white mold incidence was evaluated at the Huron County location due to adequate disease pressure. White mold was not present in either location where kidney bean testing was conducted (Montcalm or SVREC), and was not, therefore, evaluated in 2021.

Yield results are presented in pounds per acre (Lb. A⁻¹) adjusted to 18% moisture for all locations. Small and medium seeded beans were tested in Bay, Huron, Sanilac, and Tuscola counties. Large seeded beans were tested in Montcalm and Tuscola counties (SVREC). Following individual location results, yield is presented combined over locations for 2021 unless production systems differ (irrigated vs. dry land); this combining represents a one-year average across all locations. When possible, this combining is also done for two- and three-year averages across locations and years. For example, a three-year average of navy bean yields includes data from 2019, 2020, and 2021 at four locations per year (12 site years).

At the bottom of most columns, you will find the trial average (mean), least significant difference (LSD), and coefficient of variation (CV) for the data within that column. To assist in the evaluation of these results the entry with the highest numerical yield in each column (trial and year) is followed by two asterisks (**). However, entries that are not significantly different from the highest yielding entry are followed by one asterisk (*). This means that if an entry is followed by either one or two asterisks, there is **no** evidence that the entries differed for that given trait.

Table 1. Trial location, grower co-operator, planting date, nitrogen application rate, nitrogen application method, total accumulated growing degree days (GDD), and total precipitation.

County	Co-operator	Planting Date	Nitrogen Rate (lb/A)	Nitrogen Application	Total GDD*	Total Precipitation (inches)
Bay	Weiss Farms	31-May	53	Broadcast	2229	13.3"
Huron	Gentner-Bischer Farms	11-June	42	2x2	1967	14.2"
Sanilac	Keinath Farms	5-June	53	2x2	2243	15.9"
Tuscola (Kidney beans)	SVREC	6-June	42	Broadcast	2308	15.9"
Tuscola (Small and medium seed)	Zimmer Farms	4-June	42	2x2	2347	17.1"
Montcalm	Waldron Farms	3-June	42	2x2	2274	17.6" + Irrigation

*Weather data retrieved from the nearest Michigan Automated Weather Network (MAWN) and the Enviro-weather Program station nearest to the trial. All weather data is from the day of planting to October 1. Growing degree days were calculated using the following equation: ((MAX + MIN)/2)-50.

Methods & Soil Test Information

Dry beans were seeded in four row plots (20" rows) that measure 6.6' wide by 20' long. Each entry is replicated **four** times within the trial. All trials were designed as a randomized complete block (RCB). Trials received industry standard seed treatments, fertilization, and weed control applications at labeled rates. White mold fungicides were not applied to any location.

The absence of fungicide allows the evaluation of a variety's natural tolerance or avoidance to white mold when the disease is present. Yield data is obtained by direct harvest for small- and medium-seeded beans. Large seeded beans are pulled by a two row Picket bean puller and then mechanically thrashed to prevent harvest loss. Following harvest, samples are cleaned, weighed, and moisture tested. Questions regarding the 2021 performance trials or suggestions for 2022 should be directed to Scott Bales at 989-262-8550, ext. 2, or balessco@msu.edu.

Table 2. Soil test information from the six county locations, including organic matter (%OM), pH, and cation exchange capacity (CEC). All macro- and micronutrients were sufficient for dry bean production.

Location	% OM	Soil Type	pH	CEC
Bay	2.6	Sandy Clay Loam	6.8	10.9
Huron	2.8	Loam	7.6	12.1
Sanilac	3.3	Clay Loam	7.6	11.5
Tuscola (Kidney beans)	2.5	Clay Loam	7.7	16.8
Tuscola (Small and medium seed)	3.6	Clay Loam	7.6	16.6
Montcalm	2.3	Sandy Loam	6.3	7.6
