Michigan State University

Presentation at the Tegemeo Conference 2017 on “Transforming Agriculture for Inclusive Growth and sustainable livelihoods”
December 5, 2017, Nairobi, Kenya
Acknowledgements: The work highlighted here is jointly funded through the generous support of the American people through the United States Agency for International Development (USAID) under the Food Security Policy Innovation Lab and by the Bill and Melinda Gates Foundation under the Guiding Investments in Sustainable Agricultural Intensification Grant to MSU.
Introduction

• Smallholder farms constitute over 70% of farms in Africa, and majority of them are poor and food insecure

• Based on evidence from Asia, it has been generally accepted that a smallholder-led strategy holds the best prospects for achieving structural transformation and mass poverty reduction in Africa
Standard version of the structural transformation model (Mellor, 1976; Johnston and Kilby, 1975)

- Farming is the primary source of employment for the majority of the population
- Structural transformation process start with **agricultural productivity growth**
- Smallholders but productive farmers with sufficient land **produce a surplus**
- Money from the surplus production stimulates demand for goods and services
- This in turn stimulates jobs in various off-farm sectors
- Rural-urban migration, and gradual urbanization follows
- Slow rate of population growth in rural areas and land consolidation
- Agriculture declines in its relative share of total GDP over time
CONCERNS about the viability of a smallholder-led growth strategy in Africa

1. Small-scale farming in Africa has historically provided very LOW RETURNS to labor
2. Mounting POPULATION pressure and shrinking FARM SIZES
3. UNSUSTAINABLE forms of agricultural intensification with population growth
4. Changing FARM STRUCTURE-- rising proportion of land among medium-scale farms
CONCERNS about the viability of a smallholder-led growth strategy in Africa

Examining the viability of smallholder farming take on even greater policy importance in light of recent studies questioning the viability and even the objectives of promoting small-scale agriculture in Africa

“Favoring small farmers is romantic but unhelpful”

[Collier and Dercon, 2014]
CONCERNS about the viability of a smallholder-led growth strategy in Africa

1. Small-scale farming in Africa has historically provided very LOW RETURNS to labor
   - Most rural households now appear to be seeking ways to improve their livelihoods away from farming
   - Most rural households attempt to diversify into higher-return non-farm employment or getting out of farming entirely
CONCERNS about the viability of a smallholder-led growth strategy in Africa

2. Mounting POPULATION pressure and shrinking FARM SIZES

- Rising rural population densities leading to declining land sizes
- Most African farms have little control over water, are prone to frequent droughts, and have only one growing season per year
Sub-Saharan Africa: only region of world where rural population continues to rise past 2050

3. **UNSUSTAINABLE** forms of agricultural intensification with population growth

- Declining land sizes leading to **degraded soils**
- Reduced fallows leading to decline in **soil organic matter**
- **Micro-nutrient deficiencies**
- Soil **acidification** due to continued use of inorganic fertilizers
- **LEADING** to **soil-induced poverty traps**
Agricultural intensification - Kenya

CONCERNS about the viability of a smallholder-led growth strategy in Africa

4. Changing FARM STRUCTURE -- CAUSES

a) Rise in world food prices – heightened investor interest in farmland

b) Urban elite capture of land policy / farm lobbies
   • Access to capital, management expertise, ability to navigate complex traditional and/or statutory land institutions

c) Elite capture of government input and output policies

d) Rise of new towns converting remote land into valued property

e) One-way direction flow of migration from farm to off-farm sectors may not generally apply in Kenya
CONCERNS about the viability of a smallholder-led growth strategy in Africa

4. Changing FARM STRUCTURE—CONSEQUENCES [+++]

a) More capital and labor-saving technologies use—
   – Example: rising use of mechanization

b) Medium farms more productive than small-scale farms
   • Reasons to believe that capitalized and educated MS farms are more productive

c) Vent-for-surplus
   • Medium-scale farm contributing a large share of marketed surplus
   • Selling to large grain traders, get higher prices due to reduced transaction costs
CONCERNS about the viability of a smallholder-led growth strategy in Africa

4. Changing FARM STRUCTURE—CONSEQUENCES [---]

a) Growing land scarcity

b) Rising inequality of farmland distribution
   • Some displacement of smallholders

c) Is mechanization displacing agricultural employment?

Source: vanderWesthuisen, forthcoming
Conclusion

1. Smallholder farming is under siege—only a few can FARM themselves out of smallholder farming
   – Most smallholder farms have become “too small” to generate meaningful production surpluses and participate in broad-based inclusive agricultural growth processes given existing technologies

2. Continued concentration of arable land may have profound consequences for both the pace and the nature of growth within rural economies
   – Relatively egalitarian land distribution patterns have tended to generate more broadly based growth
Implications for policy

1. The “transition” issue still alive
   - How to transform Kenyan economy from current situation to more diversified and productive economy

2. Agricultural **productivity growth** will STILL be the cornerstone of any inclusive economic development and improved livelihoods:
   - Multiplier effects: ag productivity will influence the pace of growth in non-farm jobs
   - Pace of labor force exit out of farming
   - Labor productivity in broader economy

3. Multiplier effects may be much weaker when the source of agricultural growth is concentrated
3 categories of activities that promote structural transformation

1. Actions that the private sector will undertake on its own
   - Example: distribution of inputs to areas where demand is strong

2. Actions that the private sector will undertake if governments create a favorable ‘enabling environment’
   - Example: distribution of inputs to areas where demand would be strong with improved road, port, communications infrastructure

3. Actions that the private sector will not do under most circumstances and that governments must do
   - Example: Infrastructure, education, R&D, extension services
Thank You

Tomorrow belongs to people who prepare for it today
