IPM Plan Guide Sheet
Practices for Fruit Crop Production

Introduction
This tool has been designed as a guide for evaluating on-farm pest management practices for farmers interested in a Natural Resource Conservation Service (NRCS) 595 Integrated Pest Management (IPM) Plan. A 595 IPM plan is one of many practice standards offering financial assistance to farmers through the NRCS Environmental Quality Incentives Program (EQIP). This evaluation tool outlines industry standards of IPM that have been peer reviewed by universities, independent consultants, nongovernmental organizations, NRCS staff, and other state and federal agencies, and provides site specific information for implementing IPM.

EQIP is a voluntary conservation program with annual signup periods often offered in the winter. The applications are scored and funds are awarded competitively to applicants that propose cost-effective conservation practices, address local priorities, and provide the greatest environmental benefit. Contact your local USDA service center to find out specific signup dates for your state.

EQIP application information by state

Conservation plan application form – this is the required application form for applying for EQIP funds
Form CCC-1200 http://www.nrcs.usda.gov/programs/eqip/

What is IPM?
IPM is a comprehensive approach to managing pests that uses an array of practices that minimize impacts on the environment, while providing safe, effective and economical means of pest control. The principles and practices of IPM are applied to any setting where pests (e.g., insects, diseases, mammals, birds) are present. IPM practices have the added benefit of offering solutions to pest control that reduce the use of pesticides and protect resources by mitigating their impacts on the environment.

The fundamental principles of implementing IPM are as follows:

1. **Pest identification**: Proper identification of pests is necessary to identify the best options for control.
2. **Pest biology**: Understand pest life cycles, natural hosts and enemies and environmental conditions that influence pest activity.
3. **Pest monitoring**: Scout for pests and beneficial insects and trap pests through the growing season, and keep records of all pest activity.
4. **Establish action and economic injury thresholds**: Thresholds are used to determine when pest infestation is severe enough to warrant control.
5. **Select appropriate treatment strategy**: IPM relies on cultural, mechanical, biological and chemical controls for prevention or suppression of pest populations.
6. **Evaluate effectiveness of the pest management program**: IPM is not static; make changes that increase the level of IPM that is being practiced from year to year.

</tbody>
</table>
### AVOIDANCE

When planting a new crop, take note of the species previously grown and associated diseases in that area. Do not plant crops from the same family or with same pest susceptibility at less than recommended intervals for the identified pest(s).

Maintain soil aeration and drainage to avoid standing water and minimize plant disease. (e.g., use tile drainage, subsoiling, grassed waterways, raised beds, and organic matter additions.) Avoid planting in low and wet spots.

Choose pest-resistant cultivars.

</tbody>
</table>

**CHEMICAL CONTROLS**

Use fungicide combinations that allow for extended spray intervals of 10 to 14 days rather than a 7-day protectant program. Delay petal fall sprays for plum curculio, leaf rollers and codling moth as long as possible to preserve beneficial insect populations.

To preserve predatory mites, use EBDC fungicides (mancozeb, maneb, metiram, thiram and zineb) prior to bloom only or not at all.

Select pesticides, formulations, and adjuvant based on least negative effects on environment, beneficials (e.g., pollinators, predators, parasites), and human health in addition to efficacy and economics.

See environmental cautions on pesticide label and Environmental Impact of Pesticides (EIQ)⁴⁷.

Use lowest labeled rate that is effective based on label, scouting results, and Extension-recommended action thresholds for target pest.

Limit applications to partial fields or banding to reduce quantity or impact of pesticide. (e.g., spot treat where pests are found or use banding, seed, edge or block perimeter/border treatments.)

---|---|---|---|---|---|---|---|---
**NOTE:** Additional pesticide use requirements from the 595 Practice Standard:
> Always follow all pesticide label instructions and environmental cautions.
> Store, handle, transport, mix, use, and dispose of pesticides and pesticide containers per state pesticides regulatory agency recommendations and regulations.
> Follow state and federal worker protection standards.
> When drawing water for pesticide mixing from any surface waters of the state, use anti-siphoning devices and do not use hoses that have been in contact with pesticides.
> Do not mix or load pesticides within 50 ft from the high water mark of any surface waters of the state.
