

## **Funded by Soybean Checkoff Dollars**

The Soybean Cyst Nematode (SCN) is a major limiting factor in Michigan's soybean production. It's imperative that problem fields are identified for proper management of this important soybean pathogen. Identification of SCN requires inspection of root tissue and submission of soil samples to a diagnostic laboratory such as the one at MSU. Cysts are extracted from the soil to estimate the numbers of eggs and juveniles present, so risk to subsequent soybean crops can be assessed. Recommendations for management are derived from this information.

Because sampling is necessary for SCN identification, the Michigan Soybean Promotion Committee will pay the analysis costs of samples submitted to the MSU program. Please fill out the form completely (one per sample) and either deliver or mail samples to MSU Plant & Pest Diagnostics, 578 Wilson Rd., Michigan State University, East Lansing, MI 48824-6469 (517.355.4536) or deliver the sample to your local MSUE office. Sample results will be returned as quickly as possible. Details for nematode sample collection and care are outlined in MSU Ag Facts Bulletins E-2199 and E-2200 and also on the back of this flyer.

## GROWER INFORMATION

Name				this field in last 20 years?
Address				
City				Have SCN resistant varieties been grown in this field? YES NO
ZipCounty				
Phone				0: 1:1 0001
Field I.D No. Acres				
Present Crop				sample, would you like an SCN Type Test? YES NO (Requires 45-90 days to complete)
Yield of last soybean crop (bu/acre)				
SAMPLE RESULTS do not write b				MSU Case # MSPC #
Nematodes	Soil <sup>1</sup>	Roots <sup>2</sup>	Risk3	Date Rec'd
