EXTENSION

General topics

- Soil testing and basic nutrient management for vineyards **before** planting
 - Taking a representative soil sample
 - Soil pH
 - Organic matter management
 - Macronutrients
 - Micronutrients
- Suggested amendments before planting

Essential Plant Nutrients

14 nutrients derived from the soil and/or fertilizer

Macronutrients

Primary

N - Nitrogen

P – Phosphorus

K – Potassium

Secondary

S – Sulfur

Mg – Magnesium

Ca – Calcium

Micronutrients

Zn – Zinc

B – Boron

Fe – Iron

Mn – Manganese

Cu – Copper

Mo – Molybdenum

Ni – Nickel

Cl – Chlorine

Determining Nutrient Needs

- Vine vigor
- Visual symptoms
 - Yield and quality already affected
- Soil testing
- Petiole analysis

Grapes are a Perennial Crop

- ❑ Making proper decisions based on soil testing prior to planting is essential
- ❑ Once planted, only surface applications are possible
- ❑ For some amendments surface applications are inefficient or ineffective

Availability of Essential Mineral Nutrients

- ❑ Composition of the soil parent material
- ❑ Soil pH
- ❑ Soil Texture
 - Soil weathering / leaching
 - Internal drainage characteristics of the soil
- ❑ Soil organic matter content
- ❑ Competition between nutrients for uptake by the plant
- ❑ Previous fertilizer history

Soil Testing

- ❑ Soil test before planting
- ❑ Test every 4 to 5 years after planting...
 - or when a problem is suspected
- ❑ Supplements petiole testing in established vineyards

Don't Guess ..??..??
??..??..??

...*Soil Test*!!!!

Soil Testing

- pH, P, and K
 - Soil tests very well calibrated for adjusting these properties
- Ca, Mg, S, Zn, B
 - Soil tests also useful for detecting deficiencies (or excesses) of these nutrients
- Organic Matter
 - Used to adjust N rates

Soil Sampling

- ❑ Collect representative samples
 - Soil tests are only as accurate as the samples you submit
 - Sampling is often the weakest link in a soil testing program

Sampling Guidelines

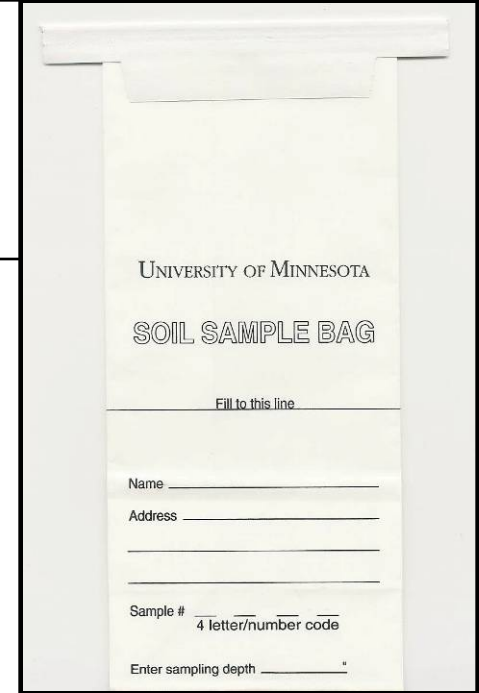

- Divide fields into uniform areas
 - Soil type, slope, crop history, previous lime, fertilizer, manure applications
 - < 20 acres for a single sample
 - < 2-3 acres on uneven land

- Collect 15-20 soil cores per sample
 - Random, zig-zag pattern across the field

Soil Sampling

- ❑ Sample to a depth of 0 to 8"
- ❑ A second sample, 8 to 16" can also be submitted
- ❑ Thoroughly mix sub-samples in a clean, plastic container
 - Submit about a pint of composite sample to testing lab
- ❑ If soil is wet
 - Air dry
 - Oven dry at $<97^{\circ}\text{F}$

Soil pH

- ❑ Ideal pH range for grapes: 6.0 to 7.0
- ❑ Low pH easily modified before planting; high pH is often a problem – particularly with high carbonates
- ❑ Difficult to change after planting

Soil pH

- Microbial activity
- Nutrient availability

Mineral soils

Modifying Soil pH

- Raising pH
 - Lime recommended if pH < 6.0
 - Rate based on buffer pH
 - Buffer pH depends on amount of clay and organic matter
 - Lime also adds Ca and Mg
 - Dolomitic lime contains Mg & Ca; Calcitic lime – mostly Ca
 - Incorporate lime 8 to 10 inches
 - Apply one year before planting

Modifying Soil pH

- Lowering pH is more of challenge
 - Acidification of high pH soils is difficult and expensive
 - Elemental sulfur used to lower pH

- Most high pH problems are on soils derived from limestone

- High pH soil can cause severe iron deficiency

Iron Chlorosis

Photographed by Elf Bergmeier

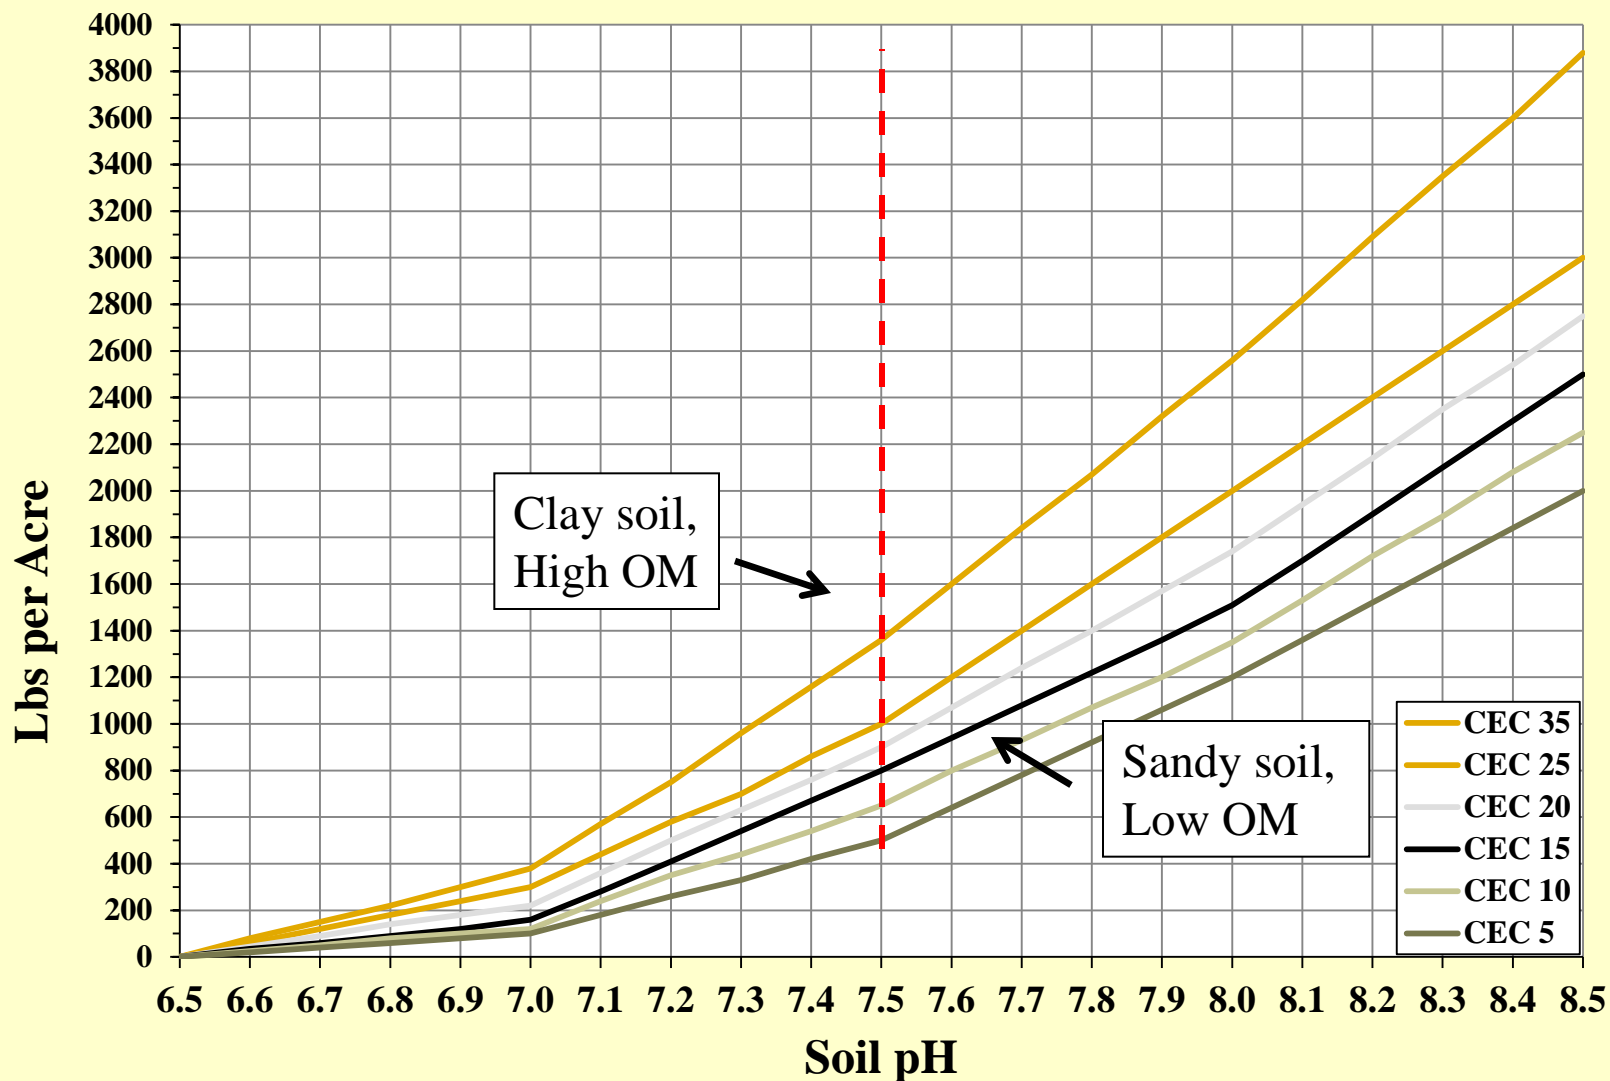

Guidelines for Lowering Soil pH

- Soil pH between 6.5 to 7.0
 - No amendments needed
- Soil pH 7.0 to 7.5
 - Apply elemental sulfur to lower the pH to 6.5 or 6.0
- Soil pH above 7.5
 - Apply sulfur to lower the pH to 6.5 or 6.0 if free of carbonates
 - If carbonates present - Not recommended due to cost
 - Use soil applied iron chelates if chlorosis is a problem

Sulfur Required to Lower the Soil pH to 6.5

For a Carbonate-free Soil

Nitrogen Fertilizer Recommendations

- ❑ Of all the essential elements nitrogen is often the most limiting
- ❑ Soil tests for nitrogen are not that reliable – most recommendations adjusted to soil organic matter level
- ❑ Nitrogen is mobile in the soil, so preplant N applications are generally not needed for grapes
- ❑ Grapes are very efficient N users – too much N will result in excessive vine growth

Soil Organic Matter Content:

Nitrogen Released from Organic Matter

Need to adjust N fertilization practices based on the organic matter content of the soil.

Nitrogen Fertilizer Recommendations

(Non-Bearing Vines – 1st or 2nd year)

- Apply inorganic N sources after planting
 - Split applications on sandy soils to reduce leaching
- Account for N from manure, compost, legume cover crops
- General N recommendations:
 - 30 lb N/ac – high OM soils (>4.6%)
 - 45 lb N/ac – medium OM soils (3.1-4.5%)
 - 60 lb N/ac – low OM soils (<3.1%)

Nitrogen Nutrition Effects on Grapes

- Deficient nitrogen
 - Poor vine growth; pale yellow leaves
 - Low sugar content
 - Low yeast assimilable nitrogen in grapes

- Excess nitrogen
 - Excessive vine growth
 - Poor fruit color

Nitrogen Fertilizer Sources

- Organic
 - Manures, compost, legume cover crops
 - Apply manure/compost based on N content
- Conventional
 - Nitrate forms - Calcium nitrate :
 - Increases soil pH
 - Readily available to plants
 - Very subject to leaching
 - Urea - $\text{CO}(\text{NH}_2)_2$:
 - Taken up as urea, or converted to $\text{NH}_4\text{-N}$ then to $\text{NO}_3\text{-N}$
 - Will volatilize with surface applications – esp. high pH soils

Nitrogen Fertilizer Sources (cont.)

- Ammonium forms – ammonium sulfate
 - Decreases soil pH
 - Converts to nitrate
 - Not prone to volatilization

Fertilizer Additions (Before Planting)

- Base P and K needs on a soil test
 - Also Mg, Zn, and B
- Very difficult to correct P and K deficiencies after vines are planted
- Broadcast and incorporate to a depth of 8 to 10 inches

Phosphorus Management

- Very immobile in the soil
 - Pre-plant soil analysis & amend before planting
- Generally not a problem for established grapes
 - Vines often do well on low P soils, but deficiencies can occur particularly on acid soils ($\text{pH} < \sim 5.3$)
 - Soil mycorrhizal organisms aid in making P available
- On low P testing soils
 - Apply manure or compost in the fall as an N source
 - Apply triple superphosphate (0-46-0) or mono ammonium phosphate (11-52-0)

Preplant Phosphorus Recommendations

Relative Soil Test P	Amount of Phosphate to Apply, lb P_2O_5 /A
Very Low	150
Low	125
Medium	100
High	75
Very High	25

Potassium Management

- Generally immobile in the soil
 - Pre-plant soil analysis & amend before planting
- Grapes susceptible to K deficiency - esp. when fruiting
 - Low K results in low fruit sugars
 - high K can increase fruit pH
- Soil K applications:
 - Potassium chloride (0-0-62)
 - Potassium sulfate (0-0-50)
 - Potassium magnesium sulfate, (0-0-22 + 22% S, 11% Mg)

Preplant Potassium Recommendations

Relative Soil Test K	Amount of Potash to Apply, lb K ₂ O/A
Very Low	250
Low	200
Medium	150
High	100
Very High	0

Potassium Stratification

Soil Depth (inches)	K Level (ppm)
0-3	250
3-8	95

Magnesium Management

- Can be a problem on sandy soils, particularly when potassium has been over applied
- If the soil pH is low (acid), apply dolomitic lime to raise the pH to 6.0 or 6.5.
- Use Epsom salts (magnesium sulfate) or potassium- magnesium (sul-po-mag) if the soil pH is in the optimal range

Preplant Magnesium Recommendations

Relative Soil Test Mg	Amount of Magnesium to Apply, lb Mg/A
Low	100
Medium	50
High	0

Micronutrients

- ❑ Most micronutrients are present in sufficient amounts in soils to meet plant needs
- ❑ Deficiencies may occur on high pH or very sandy soils.
- ❑ Iron, zinc, manganese, and boron deficiencies may occur in grapevines
- ❑ Managing soil pH will help to reduce micronutrient problems

Micronutrients

- ❑ Use of compost or manure as a nutrient source will also provide micronutrients
- ❑ Once vines are established foliar fertilizer sources can be used
- ❑ Identify micronutrient needs with petiole analysis after the second or third year of growth

Summary

- ❑ Preparing soil before planting is especially important for a perennial crop like grapes
- ❑ Use soil tests to determine preplant amendments
 - pH, organic matter (OM), P, K, Mg, S, Zn, B
 - Adjust nitrogen needs based on OM
- ❑ Once vines are established and growing, supplement soil tests with petiole analysis
