

Tart Cherry Orchard of the Future: High Density Trial at the NWMHRC

N.L. Rothwell and K.L. Powers
NW Michigan Horticultural Research Center
Michigan State University

Need for Technology and Horticultural Modernization in Tart Cherry

- Michigan Cherry Industry faces challenges from globalization
 - Inexpensive labor
 - Favorable growing conditions
 - Accessibility to suitable farmland

- Montmorency: 250+ year-old cultivar
- Mahalab: standard rootstock
- 20ft+ x 20ft+ spacings
- 30 year-old harvest technology

High Density Montmorency Planting

- Concomitantly evaluate:
 - Rootstocks
 - Tree spacing
 - Irrigation
 - Fertilization strategies
 - Tree training and pruning
 - To optimize yields without sacrificing fruit quality

Planting established at NWMHRS in 2010

Rootstocks

- Commercially available dwarfing rootstocks:
 - Gisela 3[®]
 - Gisela 5[®]
 - Gisela 6[®]
 - Mahaleb
 - Montmorency on own root
 - From tissue culture

Montmorency on own root

Spacing

- Planted at 12ft between rows and 4.5ft between trees
- Left 21ft of empty space between five-tree replicates
 - For testing future harvesters

Pruning Systems

- ***Bush:***
 - Numerous branches were left to help reduce tree vigor, imparting a small tree structure, and encouraging fast and easy tree maintenance
 - With small trees, light can penetrate readily through a properly pruned tree resulting in high fruit quality and high early yields

Pruning Systems, cont.

- ***Central/Single Leader:***
 - Characterized by one main, upright trunk
 - Branching begins on the leader 12-24 inches above the soil surface
 - Selected 3 to 4 branches in first year, which were uniformly spaced around the trunk.
 - Above the first scaffold whorl, we left an area of approximately 18 to 24 inches without any branches to allow light into the center of the tree.
 - This area is followed with another whorl of scaffolds.
 - Alternating scaffold whorls are maintained up the leader to the desired maximum tree height

Irrigation

- Double line of RAM tubing
 - emitters are 24" apart
 - emit 0.42gal/hr.
- *2010*: 5/25-7/15--1.5 hrs. of water/day (Mon.-Fri); 7/16-9/3--2.5 hrs of water/day (daily)
- *2011-2013*: 1 May- 1 Sept.--2.5hrs of water/day (daily)

Fertigation

- Double line of RAM tubing
 - emitters are 24" apart
 - emit 0.42gal/hr.
- Soluble fertilizer (28-8-18) was injected through irrigation system
 - May - August

Data Collection

- Amount of bloom
- Leaf area
- Yield – first harvest 2013
 - Used limb shaker
 - No crop in 2012
- Pull force
- Trunk diameter (for trunk cross-sectional area)
- Limb growth
- Tree efficiency

Bloom rating – May 16, 2013

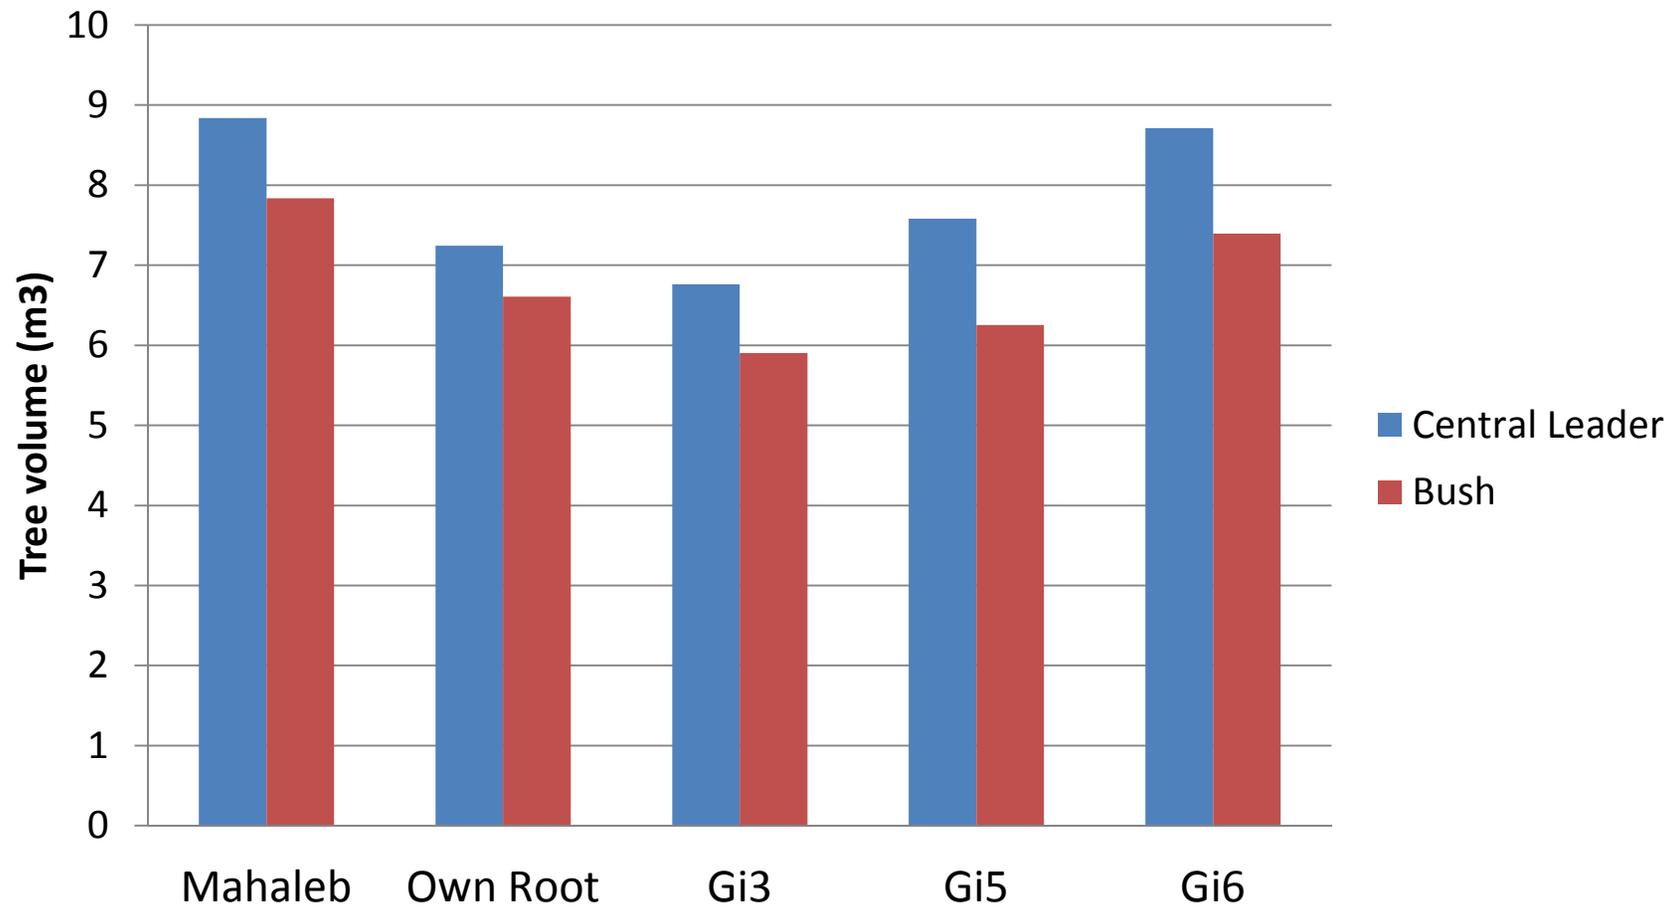

Leaf Area

measure length and width on largest leaf on 2 yr. old, non-fruiting spur, 5 leaves per tree

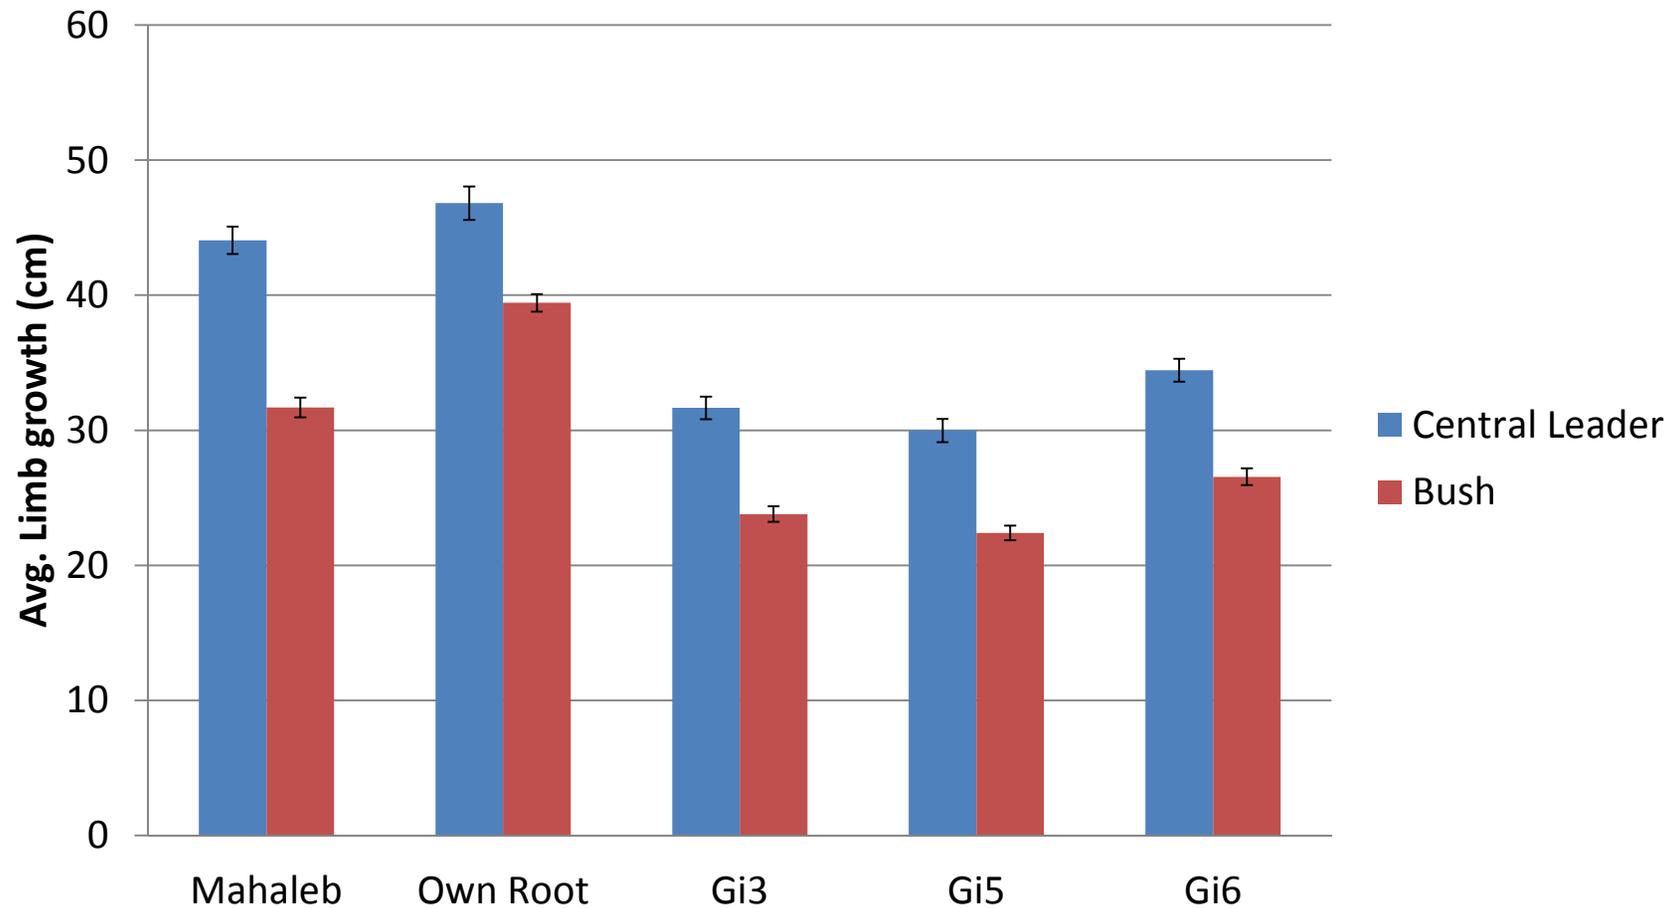

Tree Volume

height x depth x width

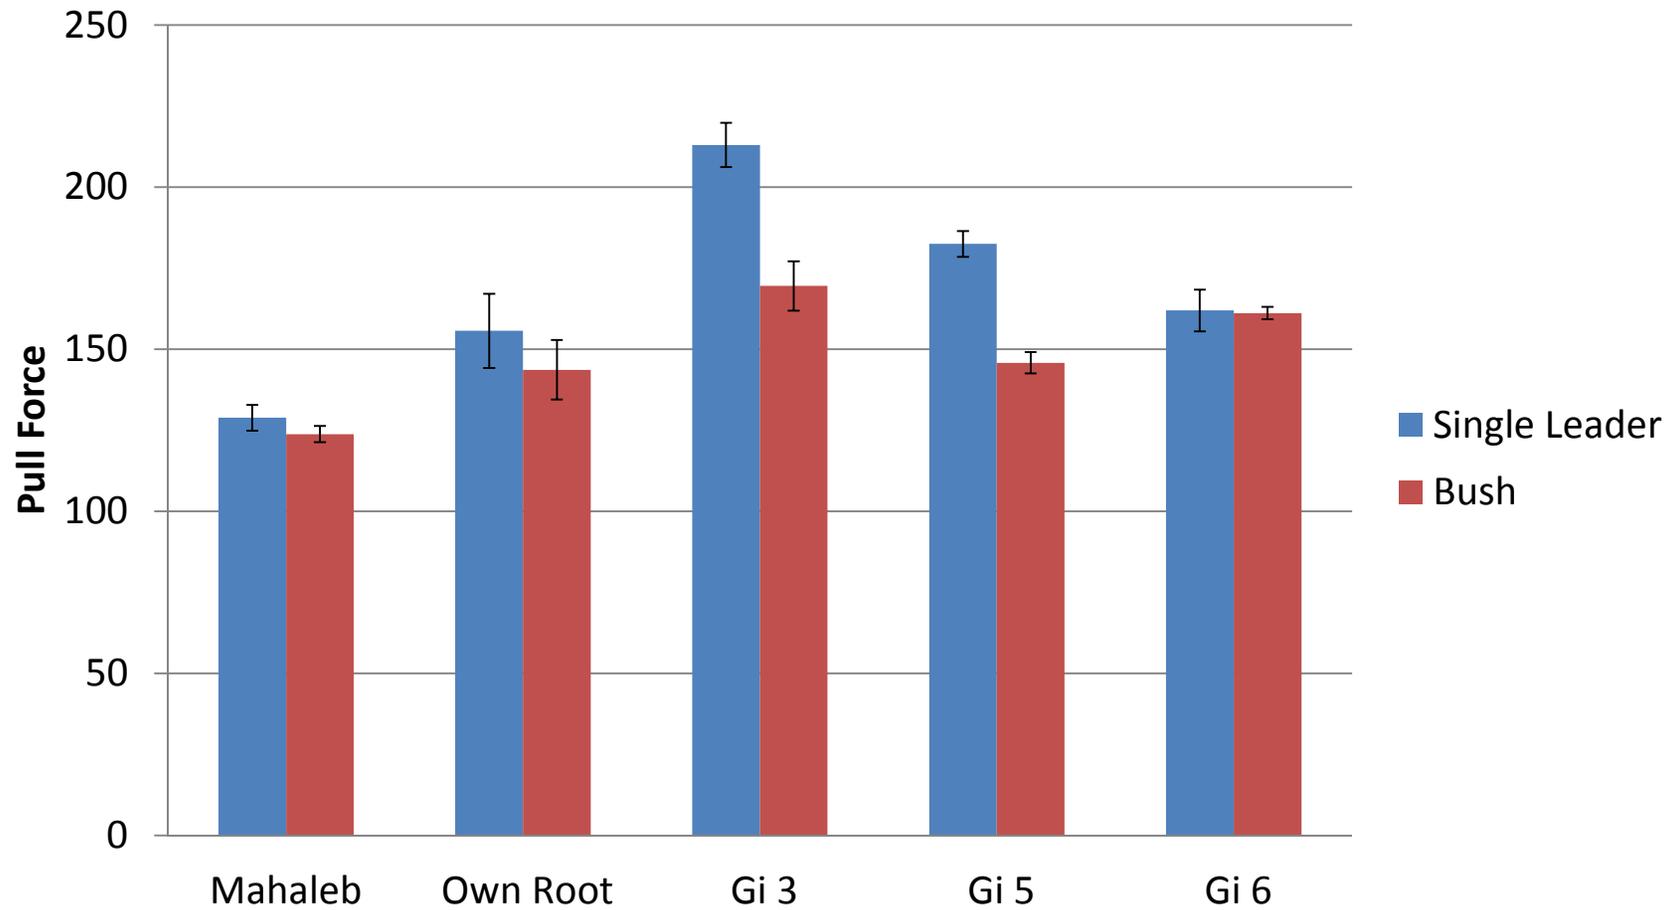

Current season limb growth

measured 4 limbs per tree in each cardinal direction, collected 8/19/13

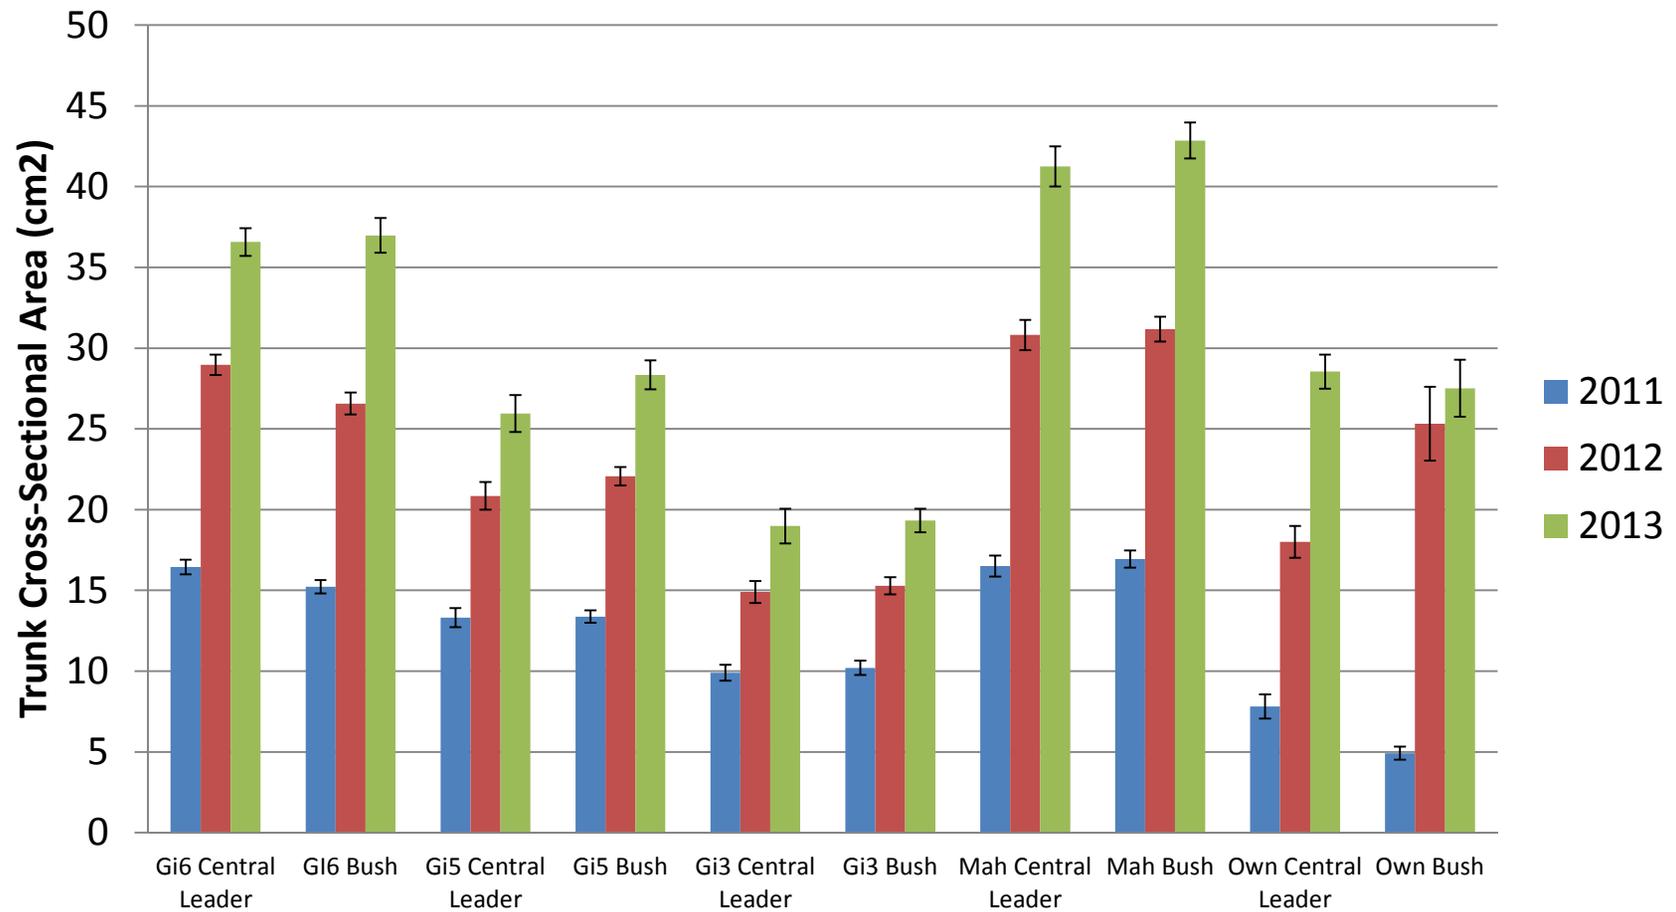

Pull force

collected 5 fruit per tree with stems attached and measured with a pull force meter

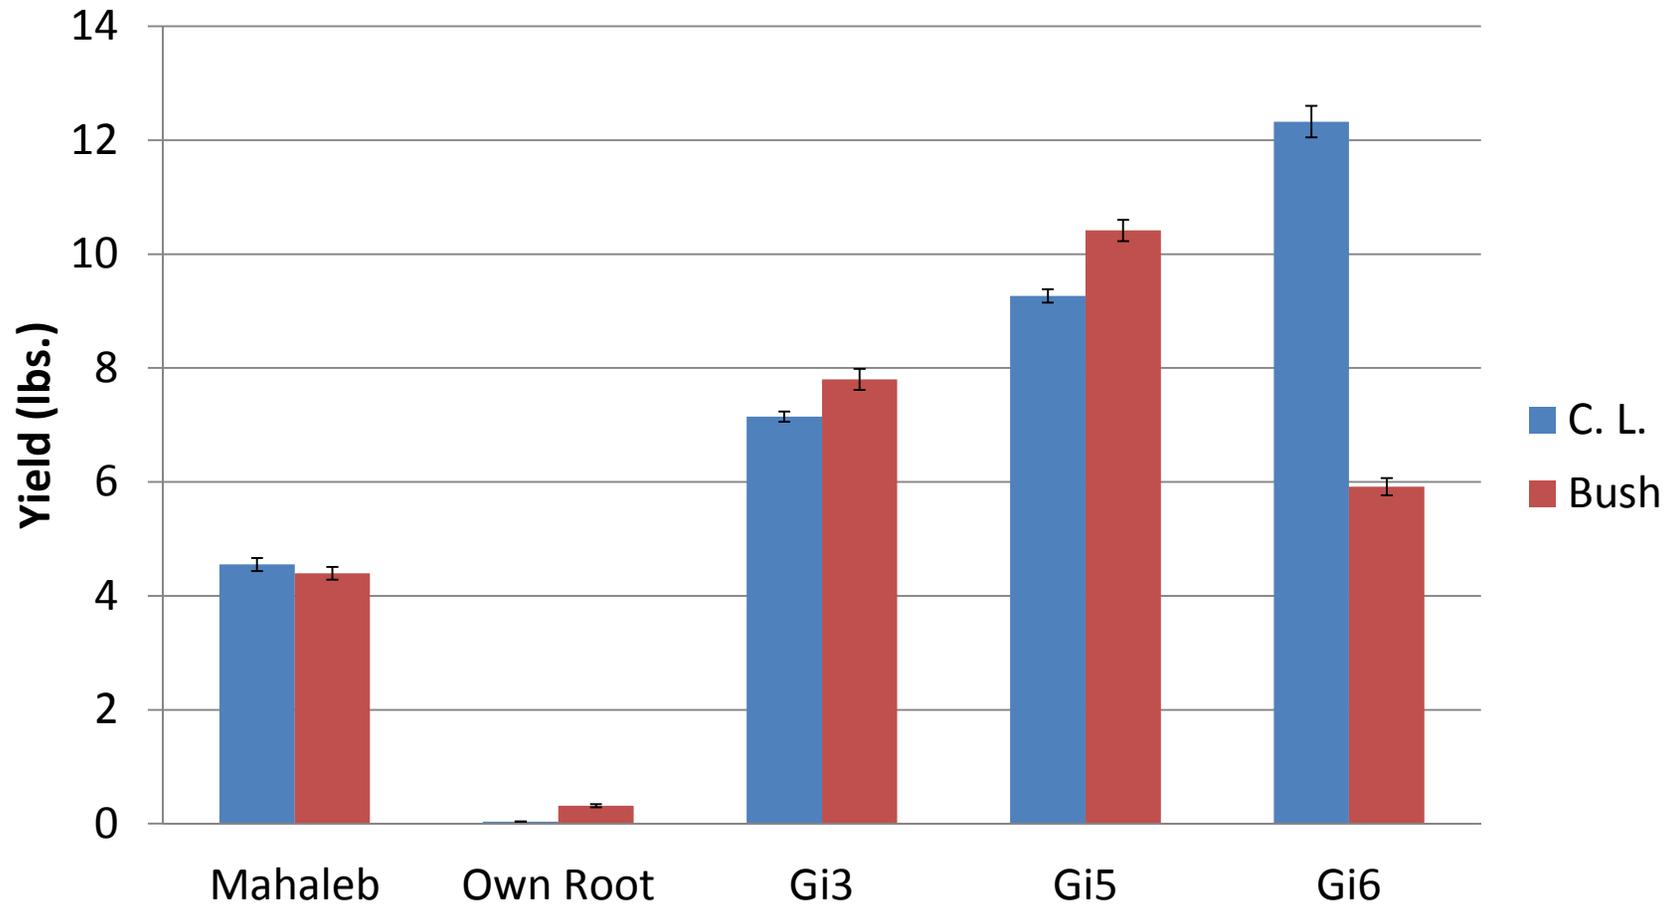

Trunk cross-sectional area (TCSA)

measure trunk diameters in fall on all trees 30cm above graft union

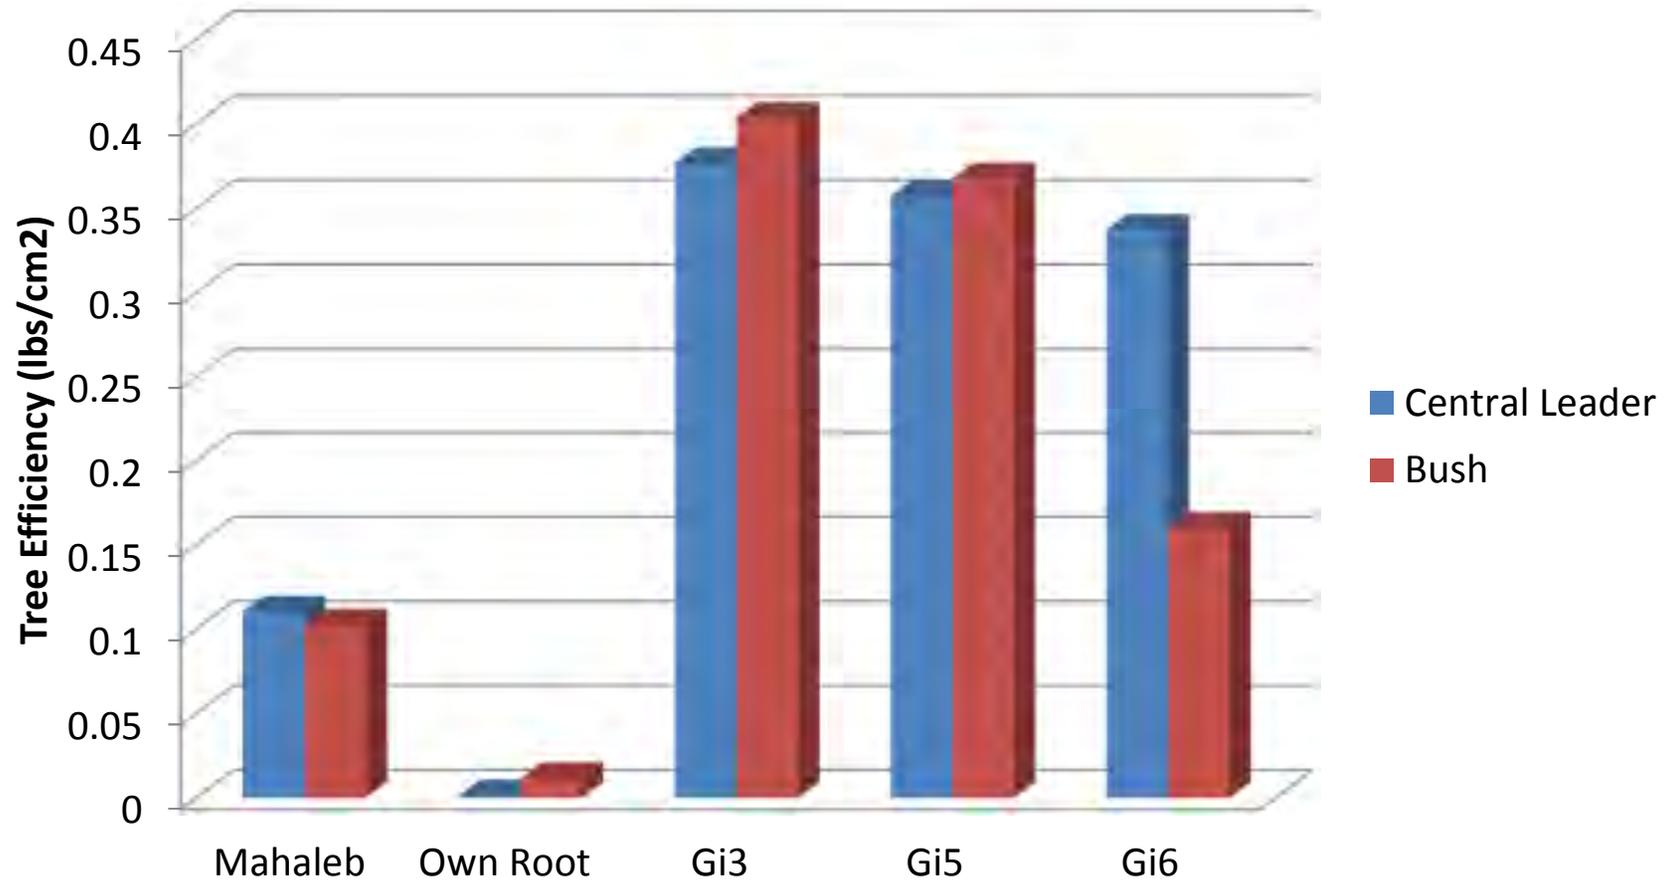

Average Yield/Tree

all fruit was harvested from individual trees with a limb shaker and weighed

Tree Efficiency

tree yield divided by TCSA

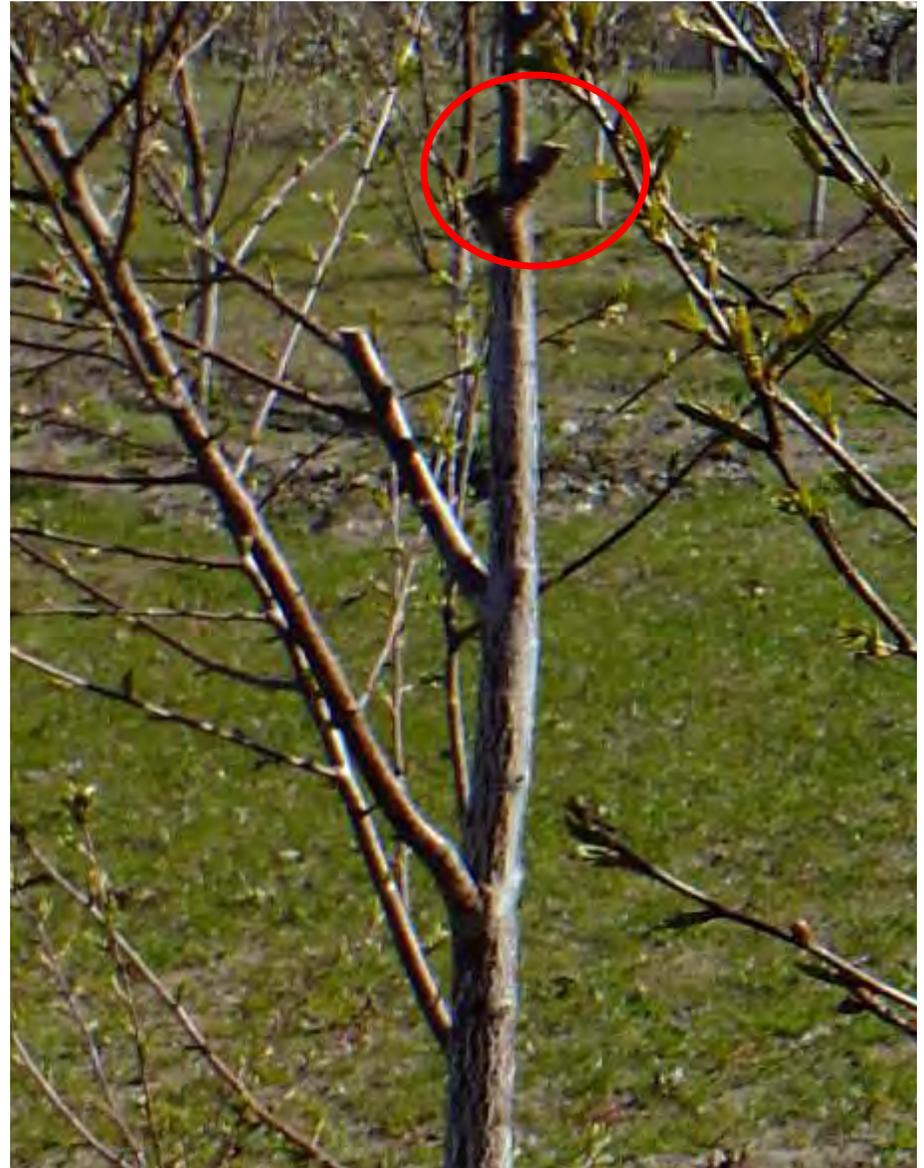

Preliminary Conclusions

- Gisela 3 and 5 had highest tree efficiencies
 - No differences between pruning systems
- Gisela 6 pruned to a central leader had a comparable tree efficiency to G3 and G5
 - G6 central leader had significantly higher tree efficiency than G6 bush
- Mahaleb has very low tree efficiency
 - In first 4 years, lots of wood and little fruit set
 - To properly recycle limbs (i.e. cut off the two biggest per year), we will be removing all wood with fruiting potential
- Montmorency on own root had no bloom in 2013

Future Management Considerations

- Issues with recycling limbs—will Montmorency push out a new limb when we leave a stub cut?
 - Evidence suggests Montmorency does not reliably push new limbs like sweet cherries

Considerations, cont.

- Will canopies be too dense to allow for adequate light penetration?
- Will we frost out more often with limbs too close to ground level?
- Is there a place for GA in this new system to manage crop loads?
