The KBS LTAR site is part of the USDA’s LTAR network, established to develop national, long-term strategies for sustainable agricultural production.

- What practice changes are needed to adapt to and mitigate climate change?

- Can we better design production systems to deliver multiple ecosystem services?

- Can modern crop and livestock systems be integrated and better managed to provide better outcomes?

Can Michigan agriculture be profitable & economically sustainable?

- We use research and stakeholder-input to compare the short- and long-term trade-offs of conventional agriculture (Business as Usual) to a system for the future (Aspirational Cropping System), which was designed by leaders in Michigan agriculture to represent “what Michigan ag could look like in 30 yrs.”

- This aspirational system seeks to maximize crop diversity, nutrient circularity & efficiency, animal integration, keep roots in the ground, and protect the soil.
We collect data over the long-term to compare how these systems affect environmental & social wellbeing.

- A team of interdisciplinary scientists and stakeholders are collecting data every year to identify and compare the success of these agricultural systems.

- While only in year two, this LTAR experiment is uniquely valuable because it will ask these questions over decades and, thus, be able to identify both the short- and long-term trade-offs in economic and environmental benefits.

We collaborate with stakeholders to ensure research is relevant & useful.

- A 15-member stakeholder advisory board guides the direction and priorities for research at the KBS LTAR. This team represents leaders in Michigan agriculture, including farmers, NGOs, agribusiness, state and federal agencies, and Extension.

In a recent meeting, scientists and board members collectively determined that our mission is to:

Bridge the gap between the agricultural system of today and the one future generations need

Our board identified several priority research needs that the KBS LTAR seeks to answer:

- How do we manage for weather extremes?
- How can a farm manage for biodiversity and profitability?
- What is the return on investment for conventional vs. the aspirational agricultural system?
